Johnny, 51 lbs. and 48" tall, in the Columbia Car Seat

Sharing the Caring

Columbia offers you solutions to the daily challenges of transporting, bathing and toileting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

▨ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! It has been the No. 1 choice since 1986, for its adjustability and stylish comfort.

#2000 Car Seat

▨ At bathtime, our popular **Reclining Chairs** and **Wrap-Around Bath Supports** allow your child – and you – to enjoy the bath.

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

#7700 Hi-Back Wrap-Around Support

☐ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

Why do these products work so well? Columbia products are thoughtfully designed, with each item available in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, tested and proven in real-life experience. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

#4200 Small Support for children

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

1116

BEST COPY AVAILABLE

VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

1115

EXECUTIVE SUMMARY[1]
SAFETY INFORMATION
FOR THE NCP® SYSTEM

INTENDED USE / INDICATIONS – UNITED STATES

The NCP System is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications.

CONTRAINDICATIONS

- The NCP System cannot be used in patients after a bilateral or left cervical vagotomy.
- Do not use short-wave diathermy, microwave diathermy, or therapeutic ultrasound diathermy on patients implanted with the NCP System. . Diagnostic ultrasound is not included in this contraindication.

WARNINGS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals. This is not intended to serve as a substitute for the complete NCP System Physician's Manual.

⚠ The **safety and efficacy** of the NCP System has not been established for uses not covered in the "Intended Use/ Indications" section of the manual.

⚠ The safety and efficacy of the NCP System treatment has not been established for stimulation of the **right vagus nerve** or of any other nerve, muscle, or tissue.

⚠ **Excessive stimulation** at a combination of high frequency (≥ 50 Hz) and an excess duty cycle (that is, one that occurs when ON time is greater than OFF time) has resulted in degenerative nerve damage in laboratory animals. An excess duty cycle can be produced by continuous or frequent magnet activation (> 8 hours), as determined by animal studies. Cyberonics recommends against stimulation at these combinations of ranges.

⚠ **Aspiration** may result from the increased swallowing difficulties reported by some patients during stimulation. Patients who have **pre-existing swallowing difficulties** are at greater risk for aspiration.

⚠ **Device malfunction** could cause painful stimulation or direct current stimulation. Either event could cause nerve damage and other associated problems. Patients should be instructed to use the magnet to stop stimulation if they suspect a malfunction, and then to contact their physician immediately for further evaluation. Prompt surgical intervention may be required if a malfunction occurs.

⚠ Susceptible patients with predisposed cardiac conduction systems (re-entry pathway) have not been studied as part of controlled clinical trials to establish the safety of NCP system treatment in these patients. Evaluation by a cardiologist is recommended if the family history, patient history, or electrocardiogram suggests an abnormal cardiac conduction pathway. Serum electrolytes, magnesium, and calcium should be documented before implantation. Post-implant electrocardiograms and Holter monitoring are recommended if clinically indicated.

⚠ **Sudden unexplained death in epilepsy (SUDEP)**: Through August 1996, 10 sudden and unexplained deaths (definite, probable, and possible) were recorded among the 1,000 patients implanted and treated with the NCP device. During this period, these patients had accumulated 2,017 patient-years of exposure. Some of these deaths could represent seizure-related deaths in which the seizure was not observed, at night, for example. This number represents an incidence of 5.0 definite, probable, and possible SUDEP deaths per 1,000 patient-years. Although this rate exceeds that expected in a healthy (nonepileptic) population matched for age and sex, it is within the range of estimates for epilepsy patients not receiving vagus nerve stimulation, ranging from 1.3 SUDEP deaths for the general population of patients with epilepsy, to 3.5 (for definite and probable) for a recently studied antiepileptic drug (AED) clinical trial population similar to the NCP System clinical cohort, to 9.3 for patients with partial onset epilepsy.

⚠ **The NCP device is not curative**: Physicians should warn patients that the NCP System is not a cure for epilepsy and that since seizures may occur unexpectedly, patients should consult with a physician before engaging in un-supervised activities, such as driving, swimming, and bathing, and in strenuous sports that could harm them or others.

⚠ **Obstructive Sleep Apnea**: Patients with obstructive sleep apnea (OSA) may have increased apneic events during stimulation. Cyberonics recommends care when treating patients with preexisting OSA. Lowering stimulus frequency or prolonging OFF time may prevent exacerbation of OSA.

PRECAUTIONS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals.

⚠ **Laryngeal irritation** may result from stimulation. **Patients who smoke** may have an increased risk of laryngeal irritation.

⚠ **Dyspnea** may result from stimulation. **Patients with chronic obstructive pulmonary disease** may have an increased risk of dyspnea.

⚠ It is important to follow **recommended implantation procedures and intraoperative product testing** described in this manual. During the intraoperative Lead Test, rare incidents of bradycardia and/or asystole have occurred. As of October 1998, approximately 3,000 patients had been implanted with the NCP System. Four of these patients were reported to have experienced **bradycardia and/or asystole** during the intraoperative Lead Test. All four patients recovered without sequelae. One of the four patients was implanted with the NCP System. There were no postoperative or VNS-treatment-related cardiac adverse events later reported for that patient. No similar events were reported to have occurred during the clinical studies at the time of implantation or during treatment. The safety of this therapy has not been systematically established for patients experiencing bradycardia or asystole during NCP System implantation.

⚠ **Reversal of lead polarity has been associated with an increased chance of bradycardia** in animal studies. It is important to make sure that the Lead connector pins are correctly inserted (white marker to + connection) into the Pulse Generator header.

⚠ It is important to follow **infection control procedures**. Infections related to any implanted device are difficult to treat and may require that the device be explanted. Cyberonics recommends that the patient be given antibiotics preoperatively. The surgeon should ensur that all instruments, including the NCP Tunneling Tool, are sterile prior to the operation.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve** in the neck area inside the carotid sheath.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve below where the superior and inferior cervical cardiac branches separate from the vagus nerve.**

⚠ A **neck brace** can be used by the patient for the first week to help ensure proper Bipolar Lead stabilization.

Environmental and Medical Therapy Hazards

⚠ Patients should exercise reasonable caution in avoiding devices that generate a **strong electric or magnetic field.** (For examples, see the "Other Environmental Hazards" section of the Physician's Manual.) If a Pulse Generator ceases operation while in the presence of electromagnetic interference (EMI), moving away from the source may allow it to return to its normal mode of operation.

⚠ NCP System operation **should always be checked** by performing device diagnostics after any of the procedures mentioned in the Physician's Manual.

⚠ Because of where the Pulse Generator is implanted in the chest, **patients may need to be specially positioned in mammography equipment for clear imaging.** Otherwise, the device may be seen as a shadow on the mammogram. (Most routine diagnostic procedures such as fluoroscopy and x-radiography, are not expected to affect system operation.)

⚠ **Therapeutic radiation** may damage the Pulse Generator's circuitry, although no testing ha been done to date and no definite information on radiation effects is available. Sources of such radiation include therapeutic x-rays, cobalt machines, and linear accelerators. The radiation effect is cumulative, with the total dosage determining the extent of damage. The effects of exposure to such radiation can range from a temporary disturbance to permanent damage, and may not be detectable immediately.

⚠ **External defibrillation** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for external defibrillation.

⚠ **Electrocautery surgery** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for electrocautery surgery.

⚠ **Magnetic resonance imaging** (MRI) should not be performed with a magnetic resonance body coil in the transmit mode. The heat induced in the Bipolar Lead by an MRI body scan can cause injury.

Use caution when other MRI systems are used, since adverse events may occur because o different magnetic field distributions

⚠ No scan in which the radiofrequency (RF) is transmitted by the body coil should be done on a patient who has the NCP System. Thus, protocols must not be used which utilize local coils that are RF-receive only, with RF-transmit performed by the body coil. Note that some RF head coils are receive only, and that most other local coils, such as knee and spinal coils, are also RF-receive only. **These coils must not be used in patients with the NCP System.**

⚠ **Therapeutic ultrasound.** Routine therapeutic ultrasound could damage the Pulse Generator and may be inadvertently concentrated by the device, causing harm to the patient.

⚠ **Extracorporeal shockwave lithotripsy** may damage the Pulse Generator. If therapeutic ultrasound therapy is required, avoid positioning the Pulse Generator part of the body in the water bath or in any other position that would expose it to ultrasound therapy. If that positioning cannot be avoided, program the Pulse Generator output to 0 mA for the treatment, and then after therapy, reprogram the Pulse Generator to the original parameters.

Diagnostic ultrasound is not expected to affect the NCP System.

⚠ The Pulse Generator may affect the operation of **other implanted devices,** such as cardia pacemakers and implantable defibrillators. Possible effects include sensing problems and inappropriate Pulse Generator responses. If the Pulse Generator patient requires concurrent implantable pacemaker and/or defibrillator therapy, careful programming of each system is necessary to optimize the patient's benefit from each device.

ADVERSE EVENTS

Adverse events reported during clinical studies as statistically significant are listed in alphabetical order Ataxia (muscle movements or twitching, generally associated with stimulation); Dyspepsia (indigestion); Dyspnea (difficulty breathing, shortness of breath); Hypesthesia (impaired sense of touch); Increased coughing; Infection; Insomnia (inability to sleep); Laryngismus (throat, larnx spasms); Nausea; Pain; Paresthesia (prickling of the skin); Pharyngitis (inflammation of the pharyn throat); Voice alteration (hoarseness);Vomiting.

Other potential adverse events possibly associated with surgery or stimulation include but are no limited to the following:

Aspiration (fluid in the lungs); Blood clotting; Choking sensation; Damage to nerves or vasculature i the surgical area, including the carotid artery and jugular vein; Device (Generator and/or Lead) migration or extrusion; Dizziness; Dysphagia (difficulty swallowing); Duodenal ulcer, gastric ulcer; Ear pain; Facial flushing; Facial paralysis, paresis; Foreign body reaction to implants, including possible tumor formation; Formation of fibrous tissue, pockets of fluid; Heart rate and rhythm changes; Hiccuping; Incision site pain; Irritability; Laryngeal irritation (sore, painful throat); Left hemidiaphragm paralysis; Left recurrent laryngeal nerve injury; Left vocal cord paralysis; Low-grade fever; Muscle pain; Neck pain; Nerve injury; Painful or irregular stimulation; Skin, tissue reaction; Stomach discomfort; Tinnitus (ringing in the ears); Tooth pain; Unusual scarring at the incision site; Urinary retention; Vagus nerve paralysis; Weight change; Worsening of asthma and bronchitis; Worsening of cardiac abnormalities, including heart rate and rhythm.

⚠ Patients who manipulate the Pulse Generator and Bipolar Lead through the skin may damag or disconnect the Bipolar Lead from the Pulse Generator and/or possibly cause damage to th vagus nerve.

---

Persistence

People with incredible burdens, chronic disorders, bad biopsies, complex disabilities and blurred horizons. They are patients, persistent patients. People who endorse Merel Meacham's observation that "In the fight for survival, a tie or a split decision simply will not do." What's with this persistence?

The word persistence is appropriately sandwiched in between the definitions of a fine hard wood tree (persimmon) and a human being (person). How exquisite this is. For, indeed, that's what being persistent is all about. It's about having unique qualities of an individual with the resolute posture of an unwavering tree. Deep-rooted trees are there for the duration. They are hard to intimidate, hard to rattle, hard to shake. And unless there is some cataclysmic natural event, chances are that the tree will see many seasons come and go. Just like people with persistence. People who began where they found themselves.

I cannot recall the first time I heard the expression, "Hang in there." Whenever it was, I know that it must have paralleled some adversity I was struggling with- or at least the perception of a struggle- by a supportive bystander. Maybe it was when I was running "wind-sprints" on a hot, August, pre-season college football camp drill-grunting, heaving, gasping for breath, clutching my side, and trying to spit through my facemask. More probably it was going into my neuro-anatomy final exam in medical school, having spent the previous twenty-eight hours trying to familiarize myself with non-concrete neural pathways that made as much sense to me as the wiring diagram of 1927 Rickenbacker tourer. Or perhaps while being wheeled into surgery hoping to outmaneuver a rogue polyp that had decided to form its own renegade malignant outposts.

"Hang in there." The words are emblematic of a philosophy and belief that if you persevere, you are bound to succeed. But we know better. As comforting as they may be, those words offer no garnets. There are no formulas for rising above adversity. Max Lerner was fond of remarking, "Somehow life doesn't always pay off to those who are most insistent." Just read the obituary columns in any newspaper on any day: ".... Died after long courageous battle against...,""... passed away after waging an admirable fight..." Sure they were fighters-and persistent ones at that-but in the end, they did not make it. There are no guarantees that a fired-up will count's for all that much. In fact, the expressions " sweet surrender," " let yourself go," and "don't fight it anymore" are by-words in many hospice scenarios.

Robert Frost's insistence that " the best way out is always through" does not always apply in every situation. Especially when you do not want "out." One quickly learned multiple-choice-test-taking rule in medical school was never to opt for the "never" and "always" choice. Those words have never occupied a safe domain in medicine. It only takes one unanticipated outcome, one surprise, one red herring, one zebra, one miraculous eleventh-hour turnaround to relegate "never" and "always" to the tundra of "we can't know or say that for sure." Medicine, mind you, has never claimed to be an exact science. And despite the emergence of Buck Rogers technology, the "art part" of the art and science of medicine still plays an important role in many successful outcomes.

It is interesting that, despite the acknowledgment by clinicians that " persistent patients" are indeed a viable and distinct entry-in fact, worthy of doctors documenting that distinction under their "clinical impressions" (almost like the "allergy red flag" marks on charts)-the phrase itself receives little exposure in medical literature. The two most popular uses of the term "persistent" (which is not found in any medical dictionary, by the way) is its descriptive use in "persistent pain" and " vegetative state." Neither alludes to the positive attributes and qualities of the "persistent patient."

Sometimes medical education is slow on the uptake. It took hundreds of years for physicians to include in their bedside clinical presentation brief insightful descriptions that relate to the "patient" outside his or her diseased state. "Patient appears to be younger than his stated age," "patient seems to be a reliable informant," patient appears histrionic," or "the patient has a good sense of humor." It would, indeed, take an astute medical student to open his Grand Rounds presentation with "Mr. Jeffries is a fifty-three-year-old, white male who presents with a persistent demeanor and a...." That description honors Mr. Jeffries and, perhaps, would change the management of his case and his relationship with the clincians treating him.

As we used to say in medical school, Bet'cha there's a journal article here somewhere."

There is a popular expression that has made its way onto bumper stickers, T-shirts, and brick buildings, "S——happens ." It described the role of chaos in everyday life, the throw of the dice in genetics, being in the wrong place at the wrong time, the unpredictability of the " happenstance of the natural world." It explains the Rube Goldberg-like connectivity of everything to everything. It is concise and universally understood. It remains a masterpiece on the economy of words. " S——happens." Indeed.

The mythological character Hercules and the African dung beetle seemingly would not have much to share over a beer. But by the third bowl of pretzels each would recognize the other as personifying the quality of persistence. Hercules had to be persistent in cleaning the Augean Stables (his sixth labor); heck, they contained three thousand cattle and had not been cleaned for thirty years. Now that is persistence. And how about that dung beetle: pushing that dung sphere (four times his size) over the arduous African terrain for miles in search of a secure mating site (location,location,location). But common, ordinary people demonstrate examples of comparable persistence every day, too.

> *"I am a kind of burr, I shall stick"*
>
> **William Shakespeare**

And it happens in Africa's Okavanga Swamp, south-central Los Angles, nuclear reactors, jazz improve sessions, and most assuredly, in molecular biology. Cells do or do not divide, blood flows or not, killer cells do or do not get off of their duffs. "S—happens," and so does oxygenation, filtration, neurotransmission, and cell scavenging. Sometimes it happens when the clinical wisdom of collective experience dismisses the possibility. It happens long after the white coats stop expecting and hoping for it. It happens (but not often enough) after it has been deleted from the clinicians' short list of expected outcomes.

One of medical science's most significant challenges is explaining the unexplainable, even when meeting with an astonished family gathered around the ICU bed of a loved one. The shock of loving family members is often expressed in the term "It happened," yet the medical team is mandated to dig deeper and answer the question "Why?"

A family viewing their sixteen-year-old linebacker miraculously emerging from a football-injury-induced coma could not care less about her histochemical changes in enzymes of energy metabolism in the dentate gyrus.

The family of a once-jovial, engaging grandfather with Parkinson's disease rejoices in an unexplained return to his pre-affliction steady gait and controlled movements. Their joy preempts any interest for the possible role of calcium and nitric oxide as early mediators of neurotoxicity. The relatively young science of psychoneuroimmunology exists to provide the " hard science" behind the milestones of the persistent patient. This discipline addresses the axis between the body's natural immune system and the complex cascade system that is in place to activate or fortify it. While the Reader's Digest showcases astonishing stories about patients' victories over catastrophic and devastating conditions, the New England Journal of Medicine reports on the re-perfusion and cyto-protective windows of brain cells.

Each in its own fashion is celebrating the adventures of the persistent patient-each hoping that it will help in replication stories of persistent Patient profiles. The persistent patient does not have to achieve (and more times does not) spontaneous and complete recovery to reap the benefits of their never-say-never stamina and determination. The persistent patient's reward very often achieved in the psychosocial arena without any change in their physiology. A stronger sense of self, the exhilaration of being a partner in one's own destiny, and the authenticating feeling of calling the shots is often enough. Success for the persistent patient is not hearing the chairperson of the department of medicine say " You were right we were wrong." It's not about one-upmanship or about final scores. It is about revering life and demonstrating to the world that, despite drawing the short straw, individuals can rise to the occasion and make a difference in their own existence. It is about being an ordinary person until your shoulder is tapped and the game starts anew. It is being a person who embraces the wisdom of Sara Teasdale when she decided that she would " make the most of all that comes and the least of all that goes." It is also demonstrating the resilient quality of the human spirit that somehow allows ordinary people to accomplish extraordinary things.

In my own field of developmental disabilities and habilitation, I do not see persistent patients. For one thing, since developmental disabilities are conditions not diseases, we first and foremost do not see the individuals we serve as patients. They are not patients until they break an arm, spike a fever, or get cancer or pneumonia or anything else that begins the medical machinery. Our Clients, in addition to having complex physical and neuro-developmental disorders, are also cognitively challenged. They are often non-vocal (but certainly not non-communicative).

HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas

The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

continued from page 15

Our clients are as persistent in their endeavors as any of the more traditional persistent patients showcased in this book. The stamina, fortitude, and endurance are remarkable. They are "persistent" in their diligence in learning new skills and in experiencing new relationships and environments. They are persistent in taking offered risks with the inherent failings and victories that risks relish. Pound-for-pound, they would give anyone a run for their money in the persistent game.

Working with "persistent people" (or, in more appropriate "people first" jargon, "people with persistence") with developmental disabilities has provided an added bonus. One cannot venture very far into the area of working with Children with Special Health Care Needs without reaping the reward from meeting "persistent parents." This last group of the three "p's" in the pod (along with persistent patients" and "persistent physicians/providers") is often the most exciting of the trilogy.

Elizabeth Stone's remarks about parents most certainly had to be directed at parents of children with chronic healthcare needs: "Making the decision to have a child-it's momentous. It is to decide forever to have your heart go walking around outside of your body." Whenever the motivation, character, and grit exhibited by persistent patients, persistent parents have it in spades. In addition to having the identical agenda of the persistent patient, the persistent parent has further distinguishing features. For one, they very often are "speaking" for their children. Coupled with the dynamism of unconditional love, parent-to-parent networking, undergo advocacy and unparalleled energy, the persistent parent is a force to reckon with and admire. These "exceptional parents" have in their cross hairs, at any one time, school administrators, bureaucrats, managed-care nay-sayers, aloof clinicians, and clueless insurance company personnel-in short, the other "p's" in the pod: payers, providers, and policymakers." Persistent parents have changed bus schedules, doorway dimensions, menus, definitions, attitudes, policies, and the law. They have had impact on research, therapies, funding, philosophies, and behavior. Perhaps their greatest achievement is that which is often described as the most challenging of all human endeavors-moving people to action!

Lorenzo's Oil, the Katy Beckett waiver, the Ryan White rulings, NORD, IDEA, ADA, Family Voices, Project DOCC, Exceptional Parent magazine all serve as testimonies to the power of parent persistence. They all stand as tributes to programs initiated by parents whom individually acknowledge that the prevailing landscape was inappropriate and needed to be changed. All significant in that those needed changes had to be carried out by parents, not politicians, professional lobbyists or deep-pocketed special interest groups. Parents. Powerful and provoked. Passionate and progressive. And always persistent. They teach and inspire me, and I unashamedly acknowledge sucking energy from them almost daily.

Persistent patients and parents are rare. Indeed, the insurance companies bank on the ordinary-to-persistent ratio daily. They understand that, if they deny reimbursement to one hundred patients and ninety-five of them go away, they have executed a sound financial strategy. Out of the remaining five, perhaps three will drop out after the third appeal is denied. The two remaining persistent patients will be paid off. Unbeknownst to the bean-counters those two "maverick" patients will serve as templates for other patients. Those two persistent patients will fuel the fires of the next batch of one hundred patients.

Persistent patients-their stories and inspiration-do not necessarily follow the computations and equations of the balance-sheet set. They often function in geometric not arithmetic progressions, defying the calculus of the actuaries. They work in the economy of passion, using the currency of determination and example. They are never quiet about their transactions and victories. Bragging rights are one of the rewards of the persistent patient, as this collection demonstrates.

Adele's tales of ordinary people refused to go gently into the night is a compelling read, not only for patients who find the pathway to persistence to be a most attractive byway, but for others as well. Plumbers, poets, painters, physicians, and puppeteersæanyone who wants to join the ranks of D.H. Lawrence's "wild things" and believes as he did that: "I never saw a wild thing sorry for itself."

H.L. Mencken said, "Every normal man must be tempted at times to spit on his hands hoist the black flag, and begin slitting throats." Persistent patients slit throats; the throats of ignorance indifference, hopelessness, indignity and ultimately fear. May readers of this book, at the right time, be inspired to hoist that black flag to new heights. EP

THANK YOU

FROM THE WORLD CONGRESS & EXPOSITION ON DISABILITIES

We would like to take this opportunity to thank everyone for their participation in and support of the WCD. For all of you who care so much about the welfare and lifestyle of people with special needs, we truly appreciate your contributions.

Special thanks goes out to EP Magazine, as well as the EP Foundation for Education, Inc.; Sigma-Tau Pharmaceuticals; the Florida Division of Vocational Rehabilitation; the Agency for Workforce Innovation; Florida ARF; PALAESTRA Magazine; FAAST, Inc.; America's Athletes with Disabilities; Office of Rare Diseases, National Institutes of Health; Allergan; Genzyme; Merrill Lynch; McDonald's Corporation; and all of our valued sponsors, exhibitors and attendees.

See you again in September

when the WCD will be returning to Orlando,
September 18 - 20, 2003!

Search & Respond

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: EP Magazines, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S

Down Syndrome and Obsessive/Compulsive Disorder

My son is ten years old and has Down syndrome. He exhibits signs of obsessive compulsive disorder, including stopping to check and recheck his actions, and often beginning again when there was nothing wrong in the first place. The resulting 'obsessive slowness' is disruptive to family life at times, and evokes frustration in all of us, which in turn is not good for our son. What is known about OCD and Down syndrome? Does anyone else also have experience with this or have any suggestions on how to help my child, especially regarding his 'obsessive slowness' behavior?

—LM via EP Web Site

S

Aggressive Social Behavior

My child was born at term with an abdominal malformation, and subsequently had a surgical repair under general anesthesia and a lengthy stay in the NICU. Now, I am looking for any information on treatments used to manage impulsive and aggressive social behavior in an otherwise competent child. If anyone can recommend publications or clinicians to turn to, that would be great.

—CB, via EP Web Site

S

Technology Help

I need assistive technology help. There are thousands of internet sites and hundreds of companies and I am having difficulty sorting through the maze. Generally, if people could recommend a few web sites, that would help. Specifically, I need to know what kind of computer to get for my home, one that would enable us to use the internet and that would also be compatible with having a cause-and-effect device installed for programs.

—DM via EP Web Site

S

Swim Diapers

I am looking for a swim diaper to fit an adult-sized 12-year-old. We have recently found a floatation suit that allows our son to go back into the pool, but his *Attends* bulk up. I need an alternative to a disposable diaper for his swim outings. I know of many other parents who are looking for the same thing. Any ideas?

—CD via EP Web Site

S

Reading Programs

I am working with a 10-year-old girl with autism and I need help on tutoring her with reading. She reads on a first or second grade level. She has done Lovaas programming. She will be going into a fourth grade classroom in the fall. If anyone has ideas, please contact me.

—B via EP Web Site

S

Behavior Problems in Traffic

I have a 10-year-old son with cerebral palsy. He is non-ambulatory. We have a conversion van equipped with a lift so that he can be transported in his motorized wheelchair, but traveling with our son is becoming almost unbearable. If we should get caught in congested traffic and need to slow down, he will start to cry and scream and will not stop until we can pick up speed and move again. This behavior is taking its toll on the entire family! My other two children do not want to travel with their brother. And there is a strain on my relationship with my husband when our son starts to cry and scream. No amount of comforting or reasoning seems to help. When we are preparing for a long trip, I try to talk and reason with our son prior to the trip. He says he is sorry, but once we hit the traffic jam or slow down for some other reason, he starts crying as if he is terrified or something is hurting. After the episode, I try talking with him to find out why he cried, and he can't seem to tell me. Does anyone have any suggestions to help us all out when traveling? Our nerves are just about shot. Thank you.

Seizure Treatment Options

My two-and-a-half-year-old son has CP, a severe swallowing disorder, and a seizure disorder. His seizures respond to seizure medications, but because he is non-verbal he cannot tell us of side effects. The last medicine, Keppra, caused nausea and gagging, and consequently worsened his gastroesophageal reflux. Because of the swallowing disorder, he aspirated and has had tracheitis (he has a tracheostomy tube in place) more often than not. We monitor him vigilantly, but it can take time for us to make a thorough analysis of what is going on with him. In the meantime, he is uncomfortable, sick, and in danger. What other treatment options exist, other than these medications with their side effects, to alleviate seizures? I've heard of the ketogenic diet, although I don't know much about it. How about natural supplements? By solving one problem we exacerbate another. I'm eager for any help or advice.

—NS, via EP Web Site

Supportive Backpacks

My son, nearing his third birthday, weighs just over 30 pounds and is about 3 feet long. He has mixed tone, arching sometimes, floppy at others. I am looking for a back pack that can hold him and give him the support he needs, including head support. I want to be able to take him for a hike in the forest. Any ideas?

—NS, via EP Web Site

Aicardi Syndrome Information

My two-month-old daughter has been recently diagnosed with Aicardi syndrome. Information on this is very limited. I am looking for information and support from other families with daughters who have this syndrome. I am very interested in information for seizure control.

—CM, via EP Magazine

Dr. Feudtner's suggested website:
http://www.aicardi.com/

Safety

Our six-year-old suffered brain damage at three months after being shaken by a daycare provider. He is developmentally delayed and has partial paralysis on the right side, although he can walk with an AFO. Developmentally he is about three. We need to move him out of his crib but are debating which is better: to get a bed that contains him so he cannot hurt himself playing with electrical outlets or to have the outlets covered or moved high on the wall. We would like suggestions from those who have faced a similar dilemma.

—NH, via EP Web Site

Aggressive Sleep Movement

I have a three-and-a-half-year-old son with CP who cannot walk or talk. He wakes up every night at about 3:30 am. His eyes are still shut but his arms and legs go a mile a minute and he cries. I have tried to talk to his doctors but they can't find anything. Anyone have suggestions?

—GM, via EP Web Site

Looking for Support

I am the mother of a nine-year-old boy who has cerebral palsy and a history of epilepsy (seizure free since brain surgery in 1995). He was doing very well up until October of last year, walking with help at the parallel bars, his speech improving, and his overall health wonderful. Then, overnight, everything just went crazy. He can no longer eat normal food, needing it to be pureed. He cannot stand to be touched, crying every time we just start to come near him. He is just slipping so fast and no one can tell us what has happened. He has been through several tests and they have all been normal. For that we are grateful, but we still don't know what has caused him to regress. If anyone has gone through something like this please feel free to email me. We would deeply appreciate talking with anyone who could possibly help us.

—TG, via EP Web Site

Rett Syndrome

Where can I find information online about Rett syndrome? Someone was describing it to me, and since my child is undiagnosed, the brief description I heard was very interesting to me.

—HL, via EP Web Site

Dr. Feudtner's suggested website:
http://www.rettsyndrome.org/

Respond

Baclofen Experiences

A has an eight-year-old boy with spastic CP who has started on oral baclofen in the last year, and she would like to have more information on the treatment.

My daughter is seven years old and has spastic diplegia. She has been on oral baclofen for about a year and a half. Although not dramatic, it does definitely help her. She "scissors" less when she walks, her feet are a little flatter; her fine motor skills (drawing, writing) have made more progress in the last year than they had in five years. Also, she seems to learn new speech sounds more readily, although still hindered by her verbal apraxia (a motor planning problem for speech). The baclofen doesn't make her sleepy, as it does a lot of kids. In fact, it actually makes her just a little

continued from page 22

hyperactive, and she can't take it in the evening because it affects her sleep and gives her nightmares. Otherwise it doesn't have any side effects for her.

—JB, via EP web site

Botox Injections

A has a nine-year-old daughter who has CP and is going for Botox injections soon.

I have a 10-year-old son with CP. He has had Botox injections in his legs a total of three times, and we have never truly seen any great results. This last set of shots I do not believe benefited him at all. Bottom line: for the cost of the injections, it was not worth the time, nor the crying we put our son through.

—GD via EP web site

Entertaining a Child with Arthrogryposis

CS has a four-year-old daughter with arthrogryposis. She has trouble walking and moving her arms, and she has undergone numerous surgeries. CS would like to hear from other parents with children who face this condition and what they can do to keep their child entertained.

I have a 19-month-old boy who was diagnosed with arthrogryposis. To keep him entertained I usually try musical cartoons and reading to him. I recently bought him an electronic keyboard. Although he can hardly use his hands, he doesn't need to use his fingers to operate this keyboard, instead using his wrist to push the keys or push a rattle lying atop the keys. You also might want to ask your child's therapist about a company called Etech. They make modified toys and they can get you the equipment to modify almost any regular toy

—S via EP web site

Reading Programs for CP Children

A has an eight-year-old daughter with severe CP and is struggling with her reading skills. She would like to know about what kinds of reading programs are available for this population.

I have a seven-year-old daughter with severe CP. She is nonverbal and uses a communication device. I am also a regular education first grade teacher. I felt it was very important that the school get an appropriate reading program for her. She was learning consonant sounds and sight words but there was no consistent program. I did a lot of research and found a program that we are going to use with my daughter this school year. It is by IntelliTools and is called Balanced Literacy. I hope this helps.

—MB via EP web site

PDD/NOS Feedback

A has a nine-year-old son diagnosed with PDD-NOS who is interested in hearing feedback from other parents who have children with this condition.

I have a five-year-old son who has been diagnosed with PDD/NOS. I read two books, *Let me Hear Your Voice* by Catherine Maurice and *Autism & Pervasive Developmental Disorder: A Mother's Story* by Karyn Seroussi. These books give hope to an otherwise hopeless feeling. After reading these books I am a firm believer that some children can and will recover or overcome this disorder. Never give up; keep fighting the good fight.

—M via EP web site

Anxiety and Seizure Control

MH has a five-year-old son diagnosed with mitochondrial encephalomyopathy who was placed on the ketogenic diet last September for seizure control. Though the seizures have subsided, his cognitive and speech skills have regressed and he has developed behavior issues including anxiety. She would like feedback from parents who have been facing a similar situation.

I also have a daughter, now 11 years old, who was once thought to have mitochondrial disease. She started having seizures two years ago and has been on Tegretol since. This year she has begun to manifest stranger anxiety and separation anxiety, which is peculiar since she used to be very social. I have come to believe that my daughter must have had a very negative experience in her school, being maltreated or treated harshly. I wonder if your child's behaviors stem from social interactions, such as having bad experiences with others and then generalizing to her interactions with others, rather than originating from a medical problem.

—R&WB via EP web site

Rights Activist on Residential Placement

TA is looking for parents who have put their children in residential care and she would like to know how to deal with the transition.

I am a disability rights activist. While I believe that people with disabilities should be able to live in the "real world," I recognize that sometimes a residential placement is the best thing for them. Sometimes a child is too medically complicated to live at home, or has behavioral issues that preclude living at home. As a matter of fact, some culturally deaf children decide to go away to a residential school when they are in high school. Just remember that this placement isn't final. Also, recognize that some (normal) kids have to go away to boarding school. You're not putting your kids in the deep dark basement of an institution and forgetting about them. They'll still be involved in life at home. They can come home for weekends and vacations. It's going to be just like they are away at school!

—T via EP web site

Who will care for your disabled child when you are gone?

Litigators Incorporated, P.C. & Affiliated Law Firms

ATTORNEYS ACROSS THE NATION

Dear Parents:

My sister died leaving behind a disabled child. If you have a child with a disability, the obligation for his or her care continues even after you are gone. My name is Jeff Brody, President of Litigators Incorporated, P.C. Let us help you find out if your child's disability was preventable; you could be entitled to substantial compensation for the lifetime care of your child. You owe it to your child to protect their future. There are time limits, please call me

Check out my web-site at www.thelitigatorsinc.com

Litigators Incorporated, P.C. is an Illinois licensed corporation with affiliated law firms throughout the United States

HYPERBARIC OXYGEN THERAPY

Dear Editor,

I'm extremely disappointed in your recent article on hyperbaric oxygen therapy. Citing unpublished data that does not appear to have a control or to be blinded is irresponsible. As you are very well aware cerebral palsy is a developmental disorder that changes over time. The failure to include a control group makes this "study" entirely uninterpretable. Additionally, if there was no blinding the outcomes are also subject to question. Methodologically outcome studies on cerebral palsy are extremely difficult to reproduce. Anyone who has tried to standardize Ashworth sales among a study group can appreciate the great deal of variability that fatigue, mood, pain and hunger can cause.

In my community we have aggressive for profit companies that market hyperbaric oxygen as a miracle cure. I have seen several families give up needed therapies and equipment to pay for this "cure." Within hours of your article endorsing hyperbaric therapy I have received calls crowing your endorsement.

I have enclosed a recent article on hyperbaric therapy that does include a control group and blinding. Please note that both study groups showed improvement with no difference between the study groups. To openly endorse a therapy, on and the basis of unreviewed uncontrolled studies is very disappointing. In my years as a subscriber I have recommended your magazine to all of my patients. If this article is not a momentary lapse, I'll have to reconsider.

Joseph J. Keeley, MD

Dear Dr. Rader,

I have been a regular reader of your magazine. As a pediatrician working in the field of Pediatric Rehabilitation, your publication has often been a good source of information for my clients and their families with respect to community resources, progress and general information about disabilities and healthy lifestyles in general.

I was intrigued to see your "Medical Research Update" article on hyperbaric oxygen therapy. I was, however, distressed to read some of the specific information that you have published, presumably under your editorial review as there was no author cited for this article.

It was with distress that I saw in your second on treating cerebral palsy your comment, "The most widely known is the 'Canadian Study' whose findings are considered interesting but not conclusive due to flaws in the design of the study."

As a practitioner in Canada, I clearly am interested when an individual flags a study in such a manner. I was, however, perturbed to learn that you have dismissed the study because it has some "flaws in the design." From my understanding and reading of the study, it is clear that it was a randomized controlled trial. This is the "gold standard" for evaluation of therapeutic interventions for individuals.

There was no clinical flaw in its design as far as I am able to determine. It was clear that the sham intervention (the use of hyperbaric room air as opposed to hyperbaric oxygen) produced an equivalent effect with individuals with cerebral palsy. If anything, those with room air therapy faired somewhat better.

This is a definitive outcome indicating that hyperaric oxygen is not beneficial for children with cerebral palsy in this situation. Unquestionably, the gold standard of reproducibility of a study over the course of time and in different settings is how we can use the scientific method to ensure veracity of our findings.

I was then more distressed to learn that you are quoting a study between January 1999 and March 2000 done by Evelyn Lipper and Maurine Packard (physicians at Weill Medical College of Cornell University). From your description of this study, it is not a randomized controlled trial. In fact, it is not even double-blinded. Although the researcher used standard assessment tools, you cited the parents' feedback noting changes in their child's progress and regression at the cession of therapy.

This therapy was in no way blinded or evaluated objectively.

You quote the conclusions of the researchers as follows: "For some children with moderate to severe CP, there is evidence that HBOT improves motor skills, attention, language and play…The changes observed do not constitute a cure of CP, but do constitute functionally substantial improvement."

It is only after such an article has gone to and been approved by peer review and then been formally published that these sorts of conclusions can be utilized by the broader medical community. By publishing this in your journal before peer review, you have bypassed this necessary check and balance system. I think that the process that you have undertaken here significantly misrepresents the status of the literature regarding hyperbaric oxygen therapy in children with cerebral palsy.

I would like to see more critical appraisal of the medical literature and review by a practitioner as well as a parent before you publish such things in your magazine. Clearly, this can be misleading when appropriate scientific review process is not applied to the literature that is out there. It is also very clear by just looking at the number of advertisers in your publication that hyperbaric oxygen therapy is obviously a money-making venture. Individuals, who are invested in such therapies as service providers, often do not have the objective point-of-view necessary to critically appraise whether or not such therapy is effective.

Sincerely,
Peter G. Rumney, MD, FRCFC

Dr. Rader replies:

EP doesn't shy away from controversy. The topic might be universal newborn screening for mitochondrial and metabolic disorders or, as in this case, an off-label use of an FDA-approved therapeutic modality. We will present all aspects of the topic in the hope that professionals, parents, families and people with disabilities will absorb the facts and be able to make their own reasoned decisions.

The efficacy of HBOT therapy for people with CP has not been determined. EP's Publisher and I have visited HBOT centers. We have spoken with many parents and caregivers, with physicians and other healthcare professionals, and they have told us of significant improvements that they have seen as a result of HBOT therapy.

We have also spoken with many practitioners who have expressed concerns similar to yours, from the paucity of research on the use of HBOT for CP to the cost of sessions. As the body of knowledge on HBOT for CP grows—whether outcomes are positive, whether improvements are short- or long-term or do not occur at all—EP will continue to cover the therapy. And we also welcome your ongoing response.

A healthy and respectful unfolding dialogue is all EP has ever hoped would emerge from our coverage on HBOT. Perhaps this controversy will eventually be the impetus for the definitive clinical trials on the use of HBOT for neurological deficits, CP and related conditions. Regardless of the outcomes, EP will be proud of its role in serving as a forum for both supporters and critics of HBOT and other controversial but compelling therapies.

"INFORMING, EMPOWERING AND KEEPING PARENTS INVOLVED"

Dear Editor,

Thank you for the excellent series of articles entitled "Informing, Empowering and Keeping Parents Involved". I want to point out an error in the first part, which may mislead parents somewhat. Ms. Gerlach states: "...the Individuals with Disabilities Education Act (IDEA) mandates that children with disabilities be provided with a free and appropriate public education and related services from birth to age 21 years..." However, IDEA only mandates FAPE (a free, appropriate, public education) for children from 3-21. IDEA Part C, the part of the law that provides for Early Intervention services to infants and toddlers from birth to three years old, allows for a system of charges for some services, provided services are not withheld for lack of ability to pay (see Sec. 303.520 of the federal IDEA regulations). These charges cannot circumvent state law, however, so that if a state has a mandate to provide FAPE from birth to 21, that state cannot charge for Early Intervention services. This fee system is also at each state's discretion so that some states may not charge any fees at all, and others will charge for all services that are not free by law. The services that must be provided free of charge to parents/families are:

- implementing the child find requirements;
- evaluation and assessment;
- service coordination; and
- any administrative and coordinative activities related to the development, review, and evaluation of IFSPs and implementation of procedural safeguards.

All other services may incur charges.

This creates great confusion for parents moving from a state which does not charge to a state such as Virginia, which has a sliding fee scale. But parents should be aware that certain charges are allowed by law for Early Intervention services in the birth-to-3 age group.

Sincerely,
Mary Wilt, RN

The editors reply:

Thank you, Ms. Wilt, for clarifying a section on early intervention from Ms. Gerlach's article. As you note, provision of Early Intervention services, and the charges they may incur, do vary from state to state. It would be wise for parents to check the situation in their state at the time their child's initial IFSP is developed.

Panel Members Sought

If you have a child with attention deficit disorder (ADD/ADHD) or are worried that he or she might have it, and would like to participate in a ongoing panel being developed by EP Magazine please email us at epedit@aol.com. Please include "ADD/ADHD Panel" in the subject line. This is not a clinical trial but part of a year-long effort to document and support the efforts of many groups to alleviate the symptoms of ADD/ADHD. Members of the panel will be asked to participate in surveys and discussions about ADD/ADHD. They may also be provided with information about treatments and ongoing research in the field.

We encourage letters on any subject. Send them to: EP Magazine, Attn: Letter to the Editor, 65 East Route 4, River Edge, NJ 07661; Fax: (201) 489-0074; or E-mail: epedit@aol.com. Published letters may be edited for space and clarity. Unless otherwise requested, writers will be identified by full name and state. Please include your phone number and/or e-mail address on all correspondence.

AN INTERVIEW WITH Francis Collins, MD, PhD, Director of the Human Genome Project

by Lucinda M. O'Neill

As the Director of the National Human Genome Research Institute (NHGRI) of the National Institutes of Health (NIH), Francis S. Collins, MD, PhD leads the Human Genome Project (HGP), a 15-year, multidisciplinary endeavor to map and sequence all of human DNA. Dr. Collins calls the work of the HGP "the most important organized scientific enterprise that humankind has ever undertaken." A working draft of the human genome sequence was announced by Dr. Collins and the HGP in June 2000 and the completed sequence is expected in the spring of 2003, two years ahead of the projected completion date of 2005. All data uncovered by the HGP have been made immediately available to the scientific community, without restrictions on access or use.

On October 4, Dr. Collins will address the third annual World Conference & Exposition on Disabilities in Orlando, FL, speaking on the medical advances arising from the Human Genome Project and their implications for improving the lives of people with genetic disorders and their families. EP Magazine spoke with Dr. Collins shortly before the conference about the current phase of the project—what he has called the "end of the beginning"—and what lies ahead for genomic medicine. Excerpts from this interview follow.

EP: Dr. Collins, how would you compare the significance of the mapping of the human genome to past medical or scientific milestones?

Dr. Collins: It's an organized scientific effort by a large group of scientists around the world to tackle a very focused and historic set of goals. In that regard, it compares most closely to sending somebody to the moon or to the Manhattan Project to split the atom. But I would argue that this project, in terms of its implications for ourselves, carries even greater weight than those, because it's an adventure into ourselves to understand how we tick. And the implications of that—medically, philosophically and societally—are profound and, I think, outstrip any previous organized scientific effort of any sort.

EP: I understand you're going to be a keynote speaker at the World Congress & Exposition on Disabilities in October.

Dr. Collins: Yes, I am. I'm looking forward to that.

EP: What message of hope do you have to offer the families of people

who have rare genetic disorders for which there is presently no cure?

Dr. Collins: Well, I can say with great certainty that the unraveling of the human genome will lead us to much more detailed insights into the causes of such rare genetic conditions. One can already see that happening: more than 50 genes involved in rare genetic diseases have been discovered in just the last couple of years because of the availability of increasingly better versions of the human genome sequence.

Accurate diagnosis based on detailed molecular understanding of rare genetic disorders will help provide answers to the cause of an illness and the likely course it will follow, and will allow an opportunity to predict more accurately what the risk of recurrence might be. Probably, though, what families are most interested in knowing is how this [information] is going to help with treatment. Ultimately we want to … [be] able to come up with interventions that are more successful than what's currently available. That outcome is going to be unpredictable and each disease will present a different set of challenges. Thus, I would be hesitant to make any sort of global prediction about how quickly therapeutic advances will happen. For some conditions, where the gene turns out to be one that we recognize and have some idea of the role it plays, it may be that an intervention as simple as a dietary change or a drug that's already on the market might provide a light bulb "Aha!" moment. Thus, considerable progress may be achieved for some conditions by the kind of molecular understanding that is going to flow from the genome project.

For other conditions, effective therapeutic interventions are going to be extremely difficult to come up with, particularly if these are conditions that have affected brain development. The idea of being able to fix a condition where there are multiple genes present in too many or too few copies, as in the case of many chromosomal disorders, is difficult to contemplate at the present time.

So I don't want to give people false hope about being able to correct genetic disorders in the near term. At the same time, I think there is reason to be hopeful about some conditions where the revelation of the genetic underpinnings will, over the course of time, lead us to exciting new ideas about what to do.

I know that this news must be hard for parents, families and people with rare genetic disorders who are left in this uncertain state. One thing I can say is that progress in understanding and treating genetic disorders is going to be completely dependent on the best and brightest minds working on the problem and provided with adequate research support.

EP: How will the work that the Human Genome Project is doing now lead to drugs that work better?

Dr. Collins: Certainly we have lots of drugs on the market that work pretty well, but we have a lot that are also somewhat frustrating, where the efficacy is less than it should be and the side effects are worse than they should be. We dream of a new era of genome-based rational drug design where one understands at the most fundamental molecular level what the problem is, and then designs a drug that specifically targets the right pathway, with minimal likelihood of interfering with other processes that would cause unpleasant or dangerous side effects.

I think perhaps this paradigm is most clearly established now for a drug called Gleevec (imatinib mesylate), a treatment for chronic myeloid leukemia. The development of this drug has been a cause of great excitement in the field, not just because it provides a wonderful new therapy for a terrible blood cancer, but also because it establishes the gene-based drug design paradigm in a broader way. What [researchers] did in this particular leukemia was to identify exactly the abnormal protein that is produced in the malignant white blood cells and then figure out its three-dimensional structure. And then they designed a small molecule—a drug—that fits in a lock-and-key fashion into the active site of that particular dangerous protein. It works like a charm. Now nearly everyone with that type of leukemia who is treated with this drug goes into remission.

EP: Well, that's certainly a cause for hope.

Dr. Collins: Indeed. If we can develop that same detailed level of understanding of a particular rare genetic disease, then it might be possible to design a drug that would either block the effect of a protein that is behaving badly or compensate for the absence of a protein that isn't being made. As an example, I'm familiar with what's going on in cystic fibrosis research because I was involved in the discovery of that gene. There are now more than a dozen drugs in clinical trials that are based on the same paradigm of understanding exactly the normal function of a particular protein, and coming up with ways to compensate for it when it's not there.

EP: You've stated that identical twins with identical DNA are also different in pretty significant ways. How do you explain that?

Dr. Collins: Identical twins are a good way of reminding ourselves that DNA is not the whole story about the essence of being human. Twins do indeed have different personalities and behaviors once you get to know them. There's a lot about who we are that is influenced by our upbringing, our school experiences, and our own choices; free will is not going to go out the window just because we've sequenced the human genome. Even more profoundly, I believe there are aspects of who we are as human beings that are more spiritual

continued on page 30

continued from page 29

in nature, and the study of DNA probably won't shed a lot of light on that.

EP: Getting to the major ethical considerations raised by the project, how do you see their impact on people with disabilities or special needs?

Dr. Collins: The genome project is unique in having recognized from the outset that these rapid advances in genetics were going to have significant ethical, legal and social implications (we refer to this as the ELSI program). Rather than waiting for somebody else to deal with those challenges later, HGP decided from the beginning to spend a portion of the budget on researching those issues and proposing possible solutions. This kind of advance preparation has not been done previously in association with an anticipated advance in science.

Issues that might be brought up here would include the genetic discrimination risk. Using genetics to cure terrible diseases is something we'd all celebrate. Using genetics to take away somebody's health insurance or job is profoundly unjust, and ought to be prohibited. Based on research in the ELSI program, a series of detailed policy analyses and strong support from leaders in the executive and legislative branches, we hope to see federal legislation implemented soon that would prevent that kind of genetic discrimination. There are bills in the United States Senate from both parties that propose explicitly how to do this, both for health insurance and for employment.

EP: What's your opinion of universal newborn screening, specifically of tandem mass spectrometry?

Dr. Collins: Newborn screening has been a wonderfully successful program since being introduced some forty years ago, initially for phenylketonuria (PKU). Most states now screen for several different rare conditions. The general criterion for including a condition in the list to be screened is that it has to be something that's treatable and, where treatment is necessary, very early.

Tandem mass spectrometry is an enormously powerful approach, because it allows you in one test to screen for a long list of relatively rare metabolic conditions. But it raises certain concerns, since application of this technology will lead to discovery of some conditions that are not treatable. Even more challenging, there will be occasional discoveries of puzzling findings of unknown significance. A newborn may be detected who is excreting a particular molecule in excess, but with no knowledge of whether that's bad or whether that's just a normal variant. That child and the parents may then be subjected to a lot of investigation and anxiety, trying to figure out what this is, only to discover it's something completely benign.

EP: What does the future hold for genetic counseling, and doesn't such knowledge portend significant responsibility for those professionals acting as counselors?

Dr. Collins: As understanding of the genetic contributions to virtually every condition grows, genetic counseling is going to become even more important than it already is. In fact, the need for this kind of counseling will be so widespread that most healthcare professionals will need to acquire some of those skills. As the genetic contributions to heart disease, cancer, and diabetes are uncovered, many people will want to know their own risk and what they can do about it. Considering the volume of such requests for information, we're going to have to mainstream this kind of individualized preventive medicine. At the same time, genetic counselors are going to be critically needed to handle the more complicated situations where only an expert can sift through the issues. That is particularly likely to be needed for rare conditions, where the average internist or nurse practitioner will not have had enough exposure to that condition to do a credible job of working through the genetic issues with the family.

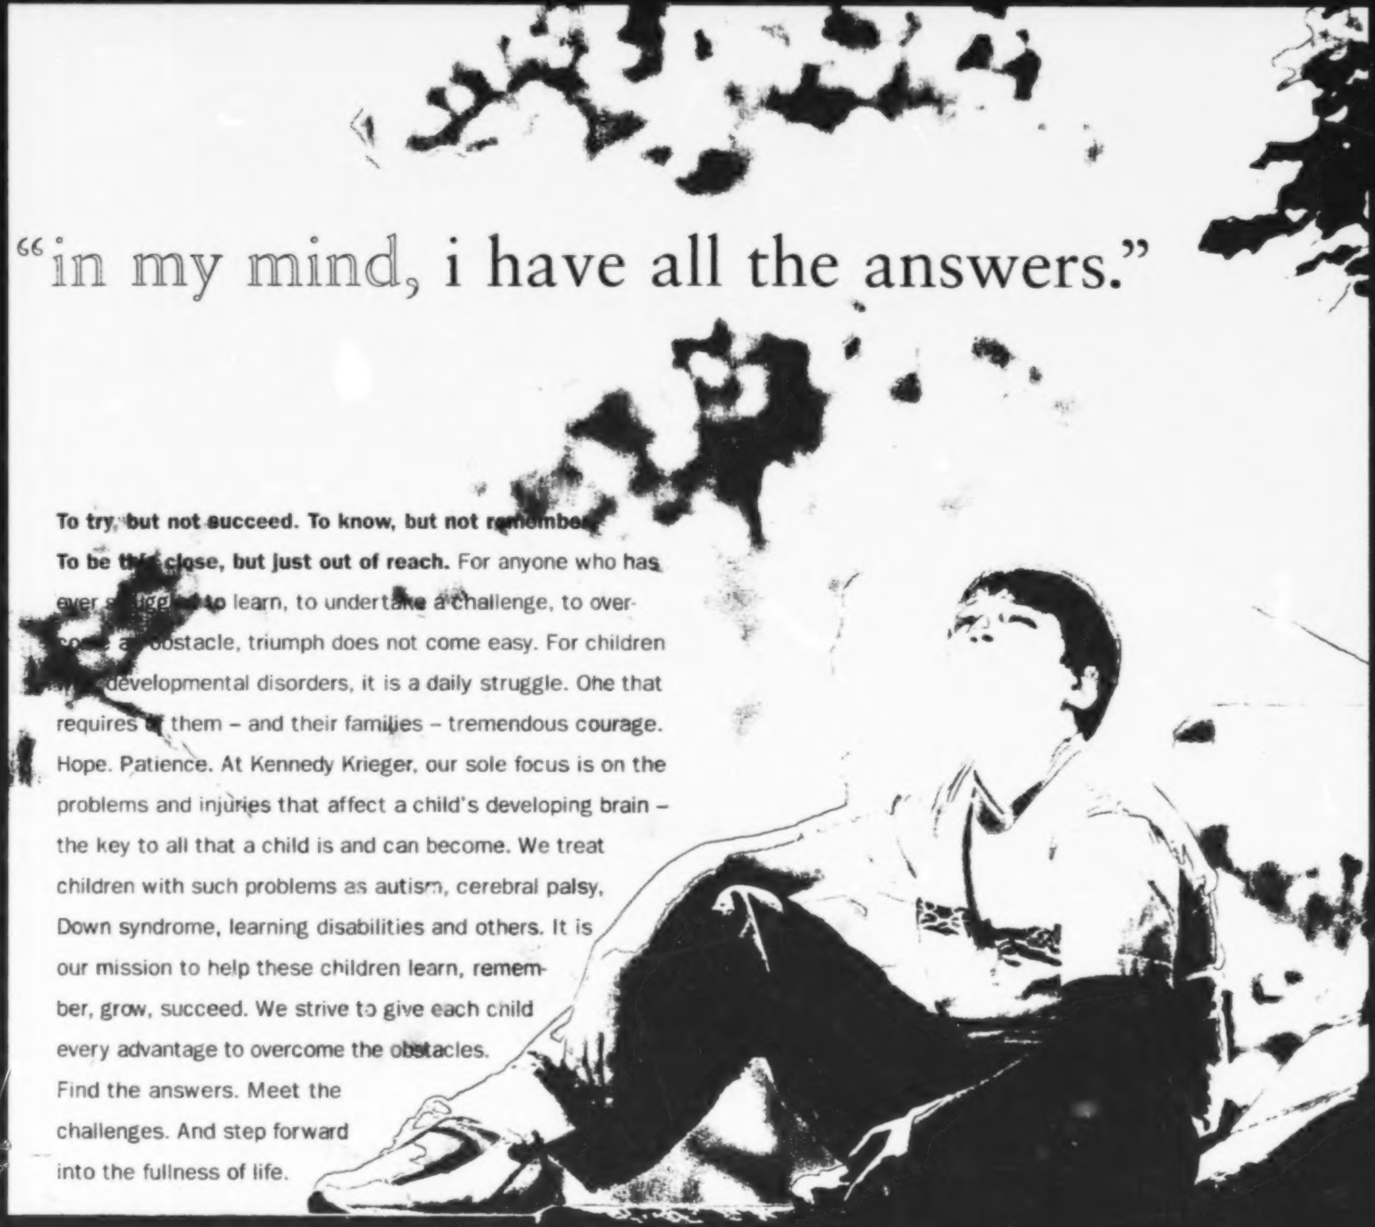
According to Dr. Martin Bax, editor of *Developmental Medicine and Child Neurology*, the human genome project has attracted widespread media attention. However, its benefits may not be directed at many children with disabilities because there are not enough to generate significant profits. He therefore believes that parents will once again need to battle for their children to have effective interventions from this scientific breakthrough.

As he writes, exploitation of the developments will be in the hands of commercial producers. Their main goal will obviously be to make money from the new products that will alleviate the most common conditions. In other words, those individuals with rare conditions will not get the attention they need, as compared to the more common disorders. It will also be difficult for many genetic researchers to keep up with the large volume of findings. Nonetheless, Dr. Bax and everyone else in the disability community welcome the advances made through the genome project.

EP: How are general practitioners going to be trained in genetic medicine over the next 10 or 20 years?

Dr. Collins: That's a big challenge, because in the past most general practitioners have not had meaningful training in genetics. And yet we're talking about them being on the front lines. How is that going to work? Together with the American Medical Association and the American Nurses Association, we've recently founded an organization called

continued on page 32



"in my mind, i have all the answers."

To try, but not succeed. To know, but not remember. To be this close, but just out of reach. For anyone who has ever struggled to learn, to undertake a challenge, to overcome an obstacle, triumph does not come easy. For children [illegible] developmental disorders, it is a daily struggle. One that requires of them – and their families – tremendous courage. Hope. Patience. At Kennedy Krieger, our sole focus is on the problems and injuries that affect a child's developing brain – the key to all that a child is and can become. We treat children with such problems as autism, cerebral palsy, Down syndrome, learning disabilities and others. It is our mission to help these children learn, remember, grow, succeed. We strive to give each child every advantage to overcome the obstacles. Find the answers. Meet the challenges. And step forward into the fullness of life.

Every child is born with great potential.
Shouldn't every child have the chance to achieve it?

the National Coalition for Health Professional Education in Genetics. It now includes 120 professional organizations that have joined up, representing most of the major specialties and subspecialties in medicine, nursing and other healthcare professions. All of these groups agree that this is an educational challenge that needs to receive high priority. That will mean putting together an educational curriculum for physicians who are already out in practice as well as influencing the curricula for medical students and nursing students so that the next generation is better prepared to deal with this coming revolution. It's going to be a challenge, but the Internet is going to help us a lot here. Probably what will help the most is the fact that patients and families are getting so well informed by using the Internet. If healthcare professionals don't get up to speed on genetics, they're going to discover quickly that the people coming to ask them questions know more than they do, and that's not something they're going to be comfortable with for long.

EP: To what extent will the profit motive guide the development of therapies for genetically-based diseases? For instance, heart disease affects many more people than rare genetic disorders and offers much greater profit potential for drug companies.

Dr. Collins: Well, that is often the way things work in our market-driven economy. Certainly pharmaceutical companies making decisions about where to put their investments in drug development are likely to put them into an area where they think they are going to have a large market. But the Orphan Drug Act can help a lot here. I think there is also a role here for the government. Speaking for the National Human Genome Research Institute, one of the areas that we would like to emphasize is new treatment ideas for rare diseases that might otherwise go unattended. As an example of this emphasis, Dr. William Gahl has just been brought on to direct our intramural clinical program. He is establishing a program that will make it possible for individuals with rare diseases, particularly those in which a diagnosis has not been yet established, to come to the NIH to our Clinical Center for a thorough and detailed evaluation, in order to define the correct diagnosis and determine whether interventions are available.

EP: What's your position on human cloning? Is it ever right?

Dr. Collins: I believe that reproductive human cloning, where the goal is to produce an individual that is a DNA copy of a current individual, has no justification. Such an effort at human cloning would be profoundly unsafe and, in my view, profoundly unethical. I personally hope that we will never see that happen.

The situation is more complicated when it comes to so-called "therapeutic" cloning. Although President [George W.] Bush has clearly stated his opposition to both forms of cloning, here the arguments are less clear, and reasonable people will disagree. There's a potential for major advances against terrible diseases like Parkinson's disease or diabetes or Alzheimer's that sound pretty exciting, although we still don't know whether the promise will be realized. At the same time, I think there are serious ethical concerns about somatic cell nuclear transfer and a question about whether the product of fusion between the nucleus of a skin cell and the cytoplasm of an oocyte should be given the equivalent moral status of an embryo. I think it's unfortunate that those discussions have polarized so rapidly. A lot of the discussion about somatic cell nuclear transfer would be benefited by a more careful understanding of the science. But at the moment, many people seem to have staked out very strong positions on the issue. In my view, it's unfortunate that this has happened so quickly.

EP: What lies ahead for the Human Genome Project?

Dr. Collins: It's wonderfully exciting to stand here on a foundation that has been built over the last 12 years, and be able to see how we can go forward from this to real benefits to health that were unimaginable 20 years ago.

It's going to be very challenging to understand how these three billion letters of our own instruction book operate in health and go awry in disease. It's going to take the best and brightest minds of the scientific community [working] over, probably, decades before we can really say we understand how human biology works. That revelation will come in incremental stages, and some insights will happen more quickly than others. Some dramatic medical applications may happen quickly, and others may be 20 years away.

EP: How would you like to be remembered?

Dr. Collins: That's a hard question. I already feel profoundly fortunate to have been asked to stand at the helm of a project with such remarkable historical significance. I would hope to be remembered as having played that role well, supported by hundreds of creative, hardworking and dedicated scientists. More than that, I would hope that my involvement has moved the possibility of human benefits, particularly the medical benefits, into becoming a reality more rapidly than they otherwise could have. If I've done that, if I've sped up by a day or a week or a year the opportunity to help someone with a serious medical problem, then that would be enough for me. EP

Toys for all

by Maria Tortoreto

It happens to all kids of all ages:

they see, they want, they ask, and if they're lucky, they get. Maybe their friends have it, maybe they saw it on television, maybe they saw it in the store. Whatever the case may be, in their mind they need to have it. And all too often, after they do get that fabulous new toy, they don't want it.

It's a universal mystery for parents: why do kids not take an interest in that toy that they spend so much money on?

Well, the answer is simple. Kids love toys that they can interact with, try new skills on and test their imagination with. Sometimes even the simplest of toys keep interest the longest. The search for quality, interest-holding toys is always difficult and hard to understand, and usually these toys are found by accident. Children with disabilities, however, have this dilemma tenfold.

Children with disabilities often cannot physically play with a toy as originally designed because they cannot interact with it correctly. They also may not have the mental capacity to understand complicated directions. Parents must always be aware of what their children are interested in and address those interests, but also be aware that if a toy is not appropriate, it is not worth buying.

Paula McSweeney, an early childhood specialist and expert on how kids learn, has a few suggestions for good toys. A good toy must:

◇ have a range of purposes
◇ be relevant to their lives (promote real life situations)
◇ expand the level of play
◇ encompass a range of skills (language, fine motor, cognitive, etc.)
◇ be fun and capture interest

Of course, a toy will not capture interest unless it also has some of the first four qualities.

We don't often realize it, but the best way for children to learn is through playing. Building with blocks helps them develop size and weight concepts, putting on dress-up clothes helps them use small muscle skills and cleaning up toys after themselves helps children accept responsibility.

While many toys are not designed specifically for children with disabilities, parents must be aware of a toy's qualities that would be appropriate for their child. "Disabilities" may have a spectrum of meaning, but some good things to watch out for are big letters, flashing lights, easy- to-hold pieces, etc.

Toys are an integral part of a child's life. Children play all day long, using toys not only as an enjoyable pastime but also as a source of envy among friends. Kids always want what others have, but if what others have isn't practical, then we should help them focus on what is practical for them. Exceptional children may have a modified version of a toy, or something completely different, but that toy may be just as enviable as the rest.

The toys contained in this month's issue have all been used by children with disabilities. While there are many specially-designed toys, our panels of teachers, students and parents recommend these playthings as particularly well suited to children with disabilities.

This year, EP Magazine has chosen to separate them into several categories. The first group represents toys, such as Play-Doh, that are perennial favorites. They are particularly well-suited for kids with disabilities as tools for both motor skills and cognitive growth. (A word of warning: children with pica should be carefully monitored so as not to put the small pieces in their mouths.)

Most of this year's products are new or updated toys chosen because they represent a unique opportunity for children with disabilities. These toys are not "special" or "modified" items but the same products purchased for all children. At the same time, they are safe, challenging and educational.

Also, we have included books, DVDs and videotapes with special appeal or interest to children with special needs.

Finally, as a tip to the future, we are recognizing a truly unique, experimental robot toy that is totally interactive. Developed with the help of government grants, Cosmobot is a robot that mimics the motions of its user. This product is only available in limited situations but is expected to be a popular item in the future.

We welcome nominees for next year's special toys at epedit@aol.com.

EP Exceptional Achievement AWARD

LINCOLN LOGS

It is hard to imagine that Japan's Imperial Hotel inspired one of America's all-time favorite toys. Yet that is exactly what happened. Lincoln Logs was the brainchild of John Lloyd Wright, whose father Frank Lloyd Wright designed that famous Tokyo building. Fear of earthquakes made the newly created construction technique necessary for the hotel.

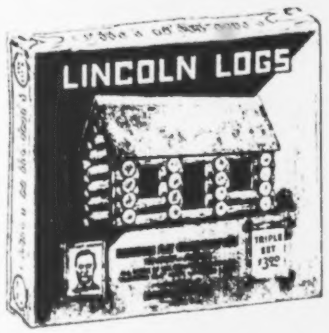
While watching the hotel's special construction techniques, John adapted the system to create Lincoln Logs in 1916. First offered for sale that year, this simple toy building set consisted of miniature hardwood logs notched on the sides to fit into each other. With the toy's elements shaped as unfinished logs, the miniature buildings mimicked the log cabins that were emblematic of American's frontier culture. Thus, Lincoln Logs harken back to a frontier which still existed when John was born. As an educational tool and a tie to pioneer days, they were valued by millions of boys and girls through the 20th century.

John's experimentation with the design of toy construction blocks reflected his own education, which emphasized rhythmic pattern, prefabrication, and construction using interchangeable elements. Lincoln Logs teach spatial relationships, require logic and conceptual thinking, enhance fine motor skills, and encourage creative design and a love of the frontier. In short, they teach and train through play.

For these reasons, EP Magazine has chosen it as the co-winner of the 2002 Exceptional Achievement Award. This award is given annually to a toy or product that has found long-term favor with children and their parents and at the same time provides exceptional educational or training benefits.

Wright's family's values centered in and around "play-full" education. Not only could he see the valuable economic opportunity in the creation of the logs, it was justifiable in terms of fulfilling a very basic and human need—construction. To John, construction meant analytical thought development in children through play; the educational style of his childhood returned him full-circle, to share with the world his practical new toy.

LINCOLN
LOGS
AMERICA'S NATIONAL TOY



The Original Lincoln Logs

The Lincoln Logs in John's original sets came in a much greater variety of sizes than today's version. This compelled children to work out what was to be built through trial and error—forcing them to observe, build, take apart and reassemble.

Historians say the original building sets could be used for the construction of log cabins that were similar to one President Abraham Lincoln lived in as a boy. Later sets became more elaborate and could be used to build forts and other more complex structures. All Lincoln Logs sets contained an instruction booklet; and although the conventional Lincoln Log was round, square logs and even bricks were also sold in the original sets. John even marketed a set called Lincoln Wheels. In 1918, when John coined the phrase "Interesting playthings typifying the spirit of America" to promote Lincoln Logs, it became the slogan for the toy's first advertising campaign.

EP'S ANNUAL TOY SECTION

Developing the toy section every year is a lengthy process. It begins in February, when members of the EP staff attend the toy industry's largest trade show and begin to accumulate information on new toys and games, and ends in early September, when the October issue goes to press. In between, we receive toy samples from the manufacturers and disseminate candidates for coverage to families and schools for their reviews and testing. The EP staff also examines toys we're sent, which means that we also get to play–and comment.

In addition to the new toys, of course, the testers look at some that have been around for years. Through this process, EP Magazine identifies two classic toys for special consideration. This year's toys were nominated and tested almost exclusively by parents and children; some special-ed teachers were included in the panel, too. They told us their favorites, and why they liked them so much. The adult testers were asked to explain to EP Magazine what toys helped children learn new skills, and stretch themselves and grow. Many were nominated via email in response to requests on the EP web site and through the magazine.

Once again, students at the Boulevard School in Ridgefield, NJ were able to play with many of the nominees at school, then take them home for further play. Thus, teachers, parents and kids provided EP Magazine with feedback–commentary, suggestions for improvement, and a sense of how much fun each toy or game engendered. In addition to the testers, we asked other experts on children's development and leaders in the toy industry to give us their suggestions.

In order to qualify for testing, all the toys had to meet a list of criteria developed by EP over the years to keep the children as safe as possible. We required that all the toys must be non-toxic, big

Like his father, John worked as an architect, but unlike his famous parent, lived a rather secluded and private life. Some have speculated that John chose his isolated life because his professional architectural accomplishments seemed slight as compared to the works of his father.

John's Lincoln Logs were an excellent addition' to the building blocks of American childhood, and definitely provided a socially thoughtful approach. It's still a product that is in line with the objectives and environment of their creator. Because they are connected to the widespread nostalgia for the American Frontier, John's Lincoln Logs continue to serve as an educational development tool—one especially useful for children with disabilities.

Play-Doh
CLEAN • NON-TOXIC

PLAY-DOH

If combined, the total amount of Play-Doh compound manufactured since1956 would weigh more than 700 million pounds, equal to the weight of 159 fully-loaded space shuttles. If all the Play-Doh compound made since 1956 was extruded through a two-inch extrusion mold, it would make a "snake" that would wrap around the world nearly 300 times.

Play-Doh's unique ability to entrance, entertain and teach as well as improve spacial coordination has earned it the accolades of parents, healthcare professionals and teachers throughout the world.

For these reasons, EP Magazine has chosen it as the co-winner of the 2002 Exceptional Achievement Award. This award is given annually to a toy or product that has found long-term favor with children and their parents and at the same time provides exceptional educational or training benefits.

Itself a 31-year-old publication, wherever EP Magazine has gone in reporting the real achievements of children and adults with disabilities, Play-Doh has been in evidence as a component of the teaching environment.

As Editor-in-Chief Dr. Rick Rader points out, "Play-Doh acts as a stimulant to the brain and the hands." More than 2 billion cans of Play-Doh compound have been sold since 1956. The toy is approaching its 50th birthday with its popularity almost undiminished since its debut.

Originally, Play-Doh Brand Modeling Compound, a non-toxic reusable modeling compound, was developed and introduced by Rainbow Crafts in Cincinnati. Today it is part of the Kenner toy group. It was first demonstrated and sold in the toy department of Woodward & Lothrop Department Store in Washington,.DC. At the start, Play-Doh compound was available only in one color and size, an off-white, one-pound can.

Next, three new colors were added to the Play-Doh line—yellow, red and blue—and the three-can pack was introduced. Early TV advertising featured Miss Frances on "Ding Dong School" and "Captain Kangaroo." Generations of children have used Play-Doh and their children and grandchildren have been entranced too.

For EP Magazine, the importance of Play-Doh is its ability to help children with disabilities improve their muscle and eye coordination and as a dynamic tool to help them create models of their thoughts. Often, Play-Doh is a method of communication between teacher and pupil; parent and child; physician and patient.

Often immitated but never duplicated, Play-Doh is truly unique—the formula for the original Play-Doh compound still remains top secret.

---

enough not to be swallowed, latex-free, without sharp edges, and sturdy enough to withstand normal play.

A particular quality we look for is a demonstrable benefit from use of the toy. For example, can a child use the toy creatively and with imagination? Does it improve fine-muscle control? Does this toy aid in teaching a child to share?

Given our audience, we try to identify toys that:

- have easy-to-manipulate pieces;
- incorporate vivid and attention getting color;
- feature large type and other visual aids;
- contain elements designed to improve spatial and physical coordination.

Any unusual feature that added to the usability of the toy by a child with disabilities was a plus, and we leaned towards toys that promote active play. For example, a video that draws the child into the action got higher grades than one where the child had only to sit and watch.

As you read and think about these toys and their applicability for your child, it is important to keep a few things in mind.

While EP ensures that all these toys have been selected according to the guidelines noted above, and tested by real people, we cannot guarantee safety, durability, or any other characteristic.

Some manufacturers provide age ranges for their toys based on their use by the child population as a whole. We urge you to use these ranges for comparative purposes only, and to choose items appropriate for your child's level of understanding and physical development.

We welcome your reactions, both positive and negative, and would be delighted to have your own suggestions for toys and games to be tested for next year. Starting in January, 2003, you may nominate toys for next year's issue at epedit@aol.com.

Now, get down on the floor and play!

continued on page 38

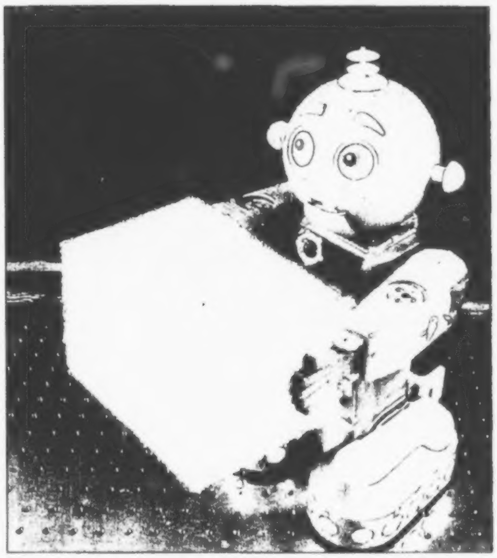
A TOY OF THE FUTURE

Developed as both a clinical tool and a toy, CosmoBot is nearing its debut and is EP Magazine's Toy of the Future for 2002. CosmoBot has the unique ability to: mimic the actions of child operators, react to their actions, and provide visual and oral feedback.

In a clinical setting, CosmoBot is able to record progress during a session without distracting the child. In a home or school environment, it interactively provides children with disabilities an outlet to experience full control and movement.

Equipped with sensors that the child wears on his or her hands or head, Cosmobot mimics both movements and voice. Also, the child or therapist can record a short story with some movements, then play it back.

CosmoBot's control panel has buttons for arm and head movements, all in real time. It can lift, grab, flap up and down and clap. It can also shake its head yes and no. The joystick on the bottom of the control panel allows the child to "drive" CosmoBot. There is also a microphone that allows the child to speak through the robot's mouth. This is great in helping quiet children become more verbal.



AnthroTronix, a leader in development of controlled electronic devices, is creating a clinical and home version. In a clinical setting, special software allows the therapist or parents to record and analyze data over a period of time. Children, engrossed in the interactivity, will not be distracted by notation actions usually associated with a progressive therapy session

AnthroTronix' studies have shown that when the therapist speaks through Cosmobot with the microphone, the child is more apt to listen to instructions. CosmoBot will also contain interactive games, such as Simon Says. For example, CosmoBot can say, "Simon says, say the word yes." The robot contains speech recognition software that deciphers correct and incorrect answers, reacting to the child's response. When Simon asks for an action , with the sensors on, the child performs the action and CosmoBot responds by saying "Good job."

CosmoBot is expected to be commercially available as early as next year. For more information visit www.anthrotronix.com.

2002 TOYS FOR ALL

Baby Cakes Sasha

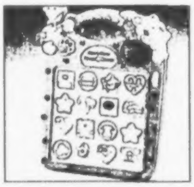
Zapf Creation—$29.99
www.shop.store.yahoo.com
877-629-9273
For ages 3 and up

Baby Cakes Sasha, from Zapf Creations, is an 16-inch upscale play doll. Baby Cakes Sasha sports a pink and white striped romper with matching hat. Under her romper, she is wearing a white long-sleeved cotton shirt with elastic at the wrists and sleeves trimmed with pink. This adorable toy is sure to be a nice addition to your family of dolls.

Ben Bear

The Ben Bear Company, LLC—
$15.99- $19.99
www.BenBearCollection.com
847-496-4087
For ages 5-12

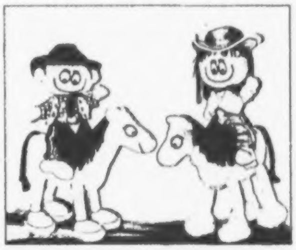
Ben Bears are available in seven colors and four fur options, to encourage collecting. Each bear features a signature denim bow tie and embroidered foot pad indicating Ben's city of origin or "place of birth." Ben Bears and their varied "home towns" help children develop a love and excitement for travel and geography at a young age.



Blue's Clues Press and Guess

Fisher-Price—$12.99
www.fisherprice.com
800-432-5437
For ages 3 and up

The Blue's Clues Press and Guess toys develop reasoning and memory skills. With Press and Guess Snacks, Joe, the host, gives kids clues to help them find the snack he's looking for, or he will test kids' memories by asking them to repeat a sequence of icons. With Press and Guess Music, Joe gives kids clues to help them find the instrument he's looking for. Kids can also press a series of musical instruments and then hear back the sequence they created.



Born to Ride

Playground Enterprises—$11.95
www.puzzlezoo.com
818-503-0161
For ages 2 and up

This toy features Danny or Sally riding a horse and is an imaginative product that is designed for play in the Wild, Wild West. The dolls and horses are all flexible enough for posing.

All prices are suggested retail costs as supplied by the manufacturers.

Bright Buddies

Darmos Toys–
$2.99 to $4.99
www.darmos.com
800-327-6674
For ages 9-14

These flashlight keychains are available in eight realistic animal styles: alligators, dolphins, whales, tigers, elephants, frogs, sharks and chimpanzees. Key chains can help children remember which backpack belongs to them or be a friendly reminder of where they put something. The mouth must be pulled open for the keychain to light, preserving battery life, and tough plastic makes the toy durable.

Call 'n Learn Video Phone

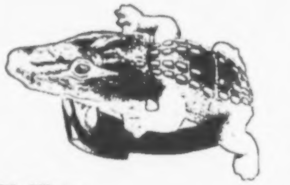
Vtech Int.–$4.99
www.mailorderexpress.com/vtechshop.html
312-297-7512
For ages 3 and up

Call 'n Learn Video Phone uses voice activation technology to help young talkers learn early phone role-play skills. The phone rings to "call" children and then responds to their voice with role-play questions. Activities reinforce community helper roles–doctor, police officer and firefighter–counting skills, safety tips and music. This phone has many realistic features such as a dial tone, working headset, light-up speed dial and even voicemail.

Cariboo

Cranium, Inc.–
$16.94
206-652-9708
For ages 3- 6
www.playcranium.com

Find castles, boats, and balloons, while exploring a golden island in Cariboo, the treasure hunting game. As kids look for bounty on the island of Cariboo, they have fun taking turns unlocking secrets, matching pictures and other activities while developing important skills with letters, numbers, colors and more.



Digitime

Darmos toys–$3.99 to $4.99
www.darmos.com
800-327-6674
For ages 3 and up

This creative spin-on watch provides kids with more than just the time. Each watch is built as one of seven cool animals that tell the date and time, and the back of every watch has information on its animal. Available styles are alligators, dolphins, elephants, lizards, monkeys, sharks and tigers.

Dizzy Disc Jr.

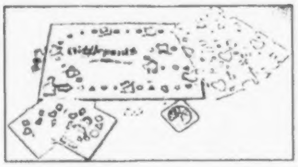
Quantum Toys–
$69.95
www.quantumtoys.com
info@quantumtoys.com
For ages 5 and up

The Dizzy Disc, Jr. has a 16-inch surface that allows for standing, sitting or kneeling. With this toy, children can hone fine motor skills and sense of balance. There is also a built-in level to adjust the difficulty of the angle.

Geosafari World Globe

Educational Insights–$59.95
www.educationalinsights.com
800-933-3277
For ages 8 and up

This unique globe offers over 5,000 geography questions that test a child's "geo-IQ". Its features include an updated world map and an easy-to-use interactive database stand. This globe provides children with hours of educational game-play.



GIGGLEPANTS™

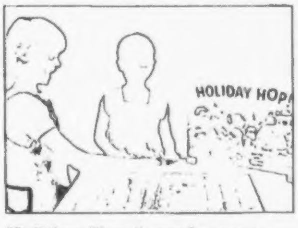
Games For All Reasons, LLC–$22.95
www.game-board.com
781-648-2029
For ages 3-5
Designed for two to four players.

Children move pawns around a board in an effort to collect six different-colored shapes. When the child lands on a shape, he or she places a cutout of that shape onto his or her own card. The first player to fill the card with all six shapes is the winner. The Gigglepants are play pants which players can put on if they land on the Gigglepants space, a character instead of a shape.

Gwigglerz

Damos Toys–$9.99 to $12.99
www.damos.com
800-327-6674
For ages 3 and up

Gwigglerz resurrect the Slinky in brightly colored animal forms such as elephants and geckos, whales and sharks, snakes and alligators. Plastic springs provide the mid-bodies for these vibrantly colorful, three-dimensional creations that can be walked on their "leashes" making them wiggle and slide. Gwigglerz are soft, springy and cute, and each has its own distinct personality that allows a child to create stories.

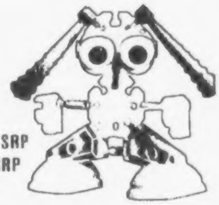


Holiday Hop board game

Liberty Games–$21.99
www.libertygamesinc.com
518-899-6559
For ages 5-12

Holiday Hop is a fast-paced game of history, facts and holidays through the calendar year. Your child will enjoy the twists and turns of this colorful game as the positions on the board change rapidly. Get to New Year's Eve and win the game! Learn well-known holidays, historical people, famous inventions and fun days, while learning color, picture matching, sequential numbering, days of the month and months of the year.

KID K'NEX™



K'NEX®–
from $9.99 SRP
to $19.99 SRP
www.toys-rus.com-
available November 2002
212-465-1290
For ages 3-7

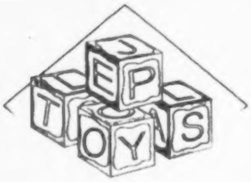
Young builders can make new friends with KID K'NEX building sets. Large chunky parts, crazy colors and big buggy eyes go together easily and are great for young minds and small hands. Each set includes plenty of KID K'NEX rods and connectors plus special feature parts and a fun picture book filled with great building ideas. KID K'NEX™ develops creativity and fine motor skills.

Hide and Seek Plush

On a Lark/Imagination Project–
$12.00
www.toyclassics.com
888.477.6532
For ages 18 months to 7 years

Talking cats play the traditional hide-and-seek game. Place the cat in its hiding place and activate the voice by pressing its paw. The cat will then repeat "I'm over here!" every 30 seconds until it's found. Once the cat is found and picked up the cat says, "You found me! Give me a big hug! Let's play hide and seek again!" After that, it's time to find a new hiding place and play again.

continued on page 40

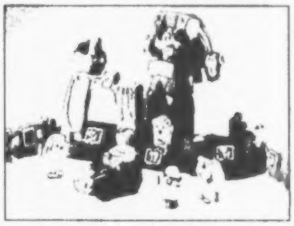


Little Doctor Kit

Little Doctor Kit

International Playthings–$18.99
www.intplay.com
info@intplay.com
For ages 2 and up

The Little Doctor Kit has an electronic stethoscope that makes a heartbeat and coughing sound. The blood pressure gauge with arm cuff includes a pump with a spinning dial. The set also includes a doctor bag, reflex hammer, thermometer, squeaking syringe, auriscope, laryngoscope and pretend bandage. The stethoscope includes 3 button cell batteries.



LITTLE PEOPLE® ANIMAL SOUNDS ZOO

Fisher-Price–$19.99
www.fisherprice.com
800-432-5437
For ages 1-5

Toddlers will learn all about the different animals that live at the zoo and discover the different sounds they make. This interactive playset comes with six animals including an elephant, polar bear, lion, seal, monkey and a bird, plus a zoo keeper, food basket, vehicle and two connecting fences to extend play out and around the zoo.

Maggie Raggies Sweetie Singer

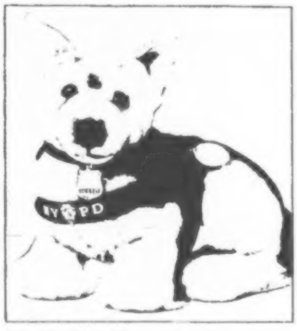
Zapf Creation AG- $29.99
www.zapf-creation.com
877-629-9273
For ages 3 and up

Maggie Raggie Sweetie Singer is 18" long with a flexible frame, plush body, soft hair, Velcro hands for holding accessories, playful facial expressions and a wire skeleton for posing and standing. Children will be able to bring her to life by pressing on her belly and listening to her sing– the harder her tummy is pressed, the louder she will sing.

NameTrains

Maple Landmark–$4.75-$52.75
www.vtwood.com
800-421-4223
For ages 3 and up

NameTrains are simple enough for a young child to enjoy and diverse enough with accessories, blocks and track to keep older children engaged and entertained. Each train car is in the shape of a letter; they come in six different non-toxic vibrant colors. Each letter stands about 2.5 inches high and 3 inches long. They connect with simple magnets and are compatible with other wooden track systems and most related accessories. Solid construction of New England rock maple, easy-roll wheels and strong magnets gives the letters durability.



NYPD Plush

Applause, LLC–$8.00 to $25.00
www.applause.com
800-777-6990
For all ages

Kids can play with these soft plush dolls from the NYPD and Applause toys. The dolls include a rendition of Apollo from the city's K-9 Unit as well as a number of the horses from the Mounted Unit line.

POWER PUMPER

Columbia-Inland Corporation–$150
www.powerpumper.com
888-215-7867
For ages 5-11

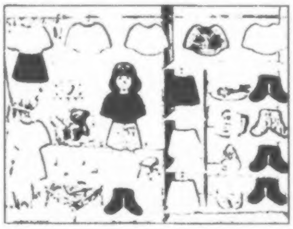
This innovative, award-winning design moves by a unique push-pull rowing motion of a pumper bar that also steers the ride-on toy. The Power Pumper 2000 is an Industrial Design Excellence Award (IDEA) winner and has been named the world's safest ride-on.. With its full body play, children can have fun while getting the exercise they need.

Roll With It, Baby! Roller

Imagiix Milestones–$14.95
www.babyscholars.com
800-462-4449
For infants ages 6-12 months

The Roll With It, Baby! roller is a plastic cylinder that inflates to 16"x 9" and is covered with a colorful, soft, machine-washable cloth. The soft fabric cover has a fun theme featuring a dog, cat, mouse and cheese. Each end contains two jingling bells for added enjoyment. Made for infants, the Roll With It, Baby! roller can help introduce a baby to rolling, balancing and pushing.

TEXTURED DRESS -UP PUZZLE



Lights, Camera, Interaction!– around $14.99
www.inquisitoy.com
800-284-3948
For ages 3 and up

The Textured Dress-Up Puzzle has 18 interchangeable dress-up puzzle pieces in a variety of bright, colorful patterns and materials. Carved wooden pieces make moving and manipulating the outfits easy, while the various textures (silky, plush, patterned, shiny, etc.) can be mixed and matched to create beautiful outfits and build on the child's sensory awareness and vocabulary skills. This classic-style wooden puzzle includes 7 blouses, 6 skirts and 5 pairs of shoes.

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing can, even in a small way, change a child's way of life.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus, they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Imagine your child gaining a little more independence just from a change in clothing. For information on how GoodNites can help, please visit us at www.goodnites.com/sn.

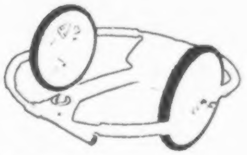
U.S. Dogs
U. S. Dogs—$48.00
www.us-dogs.com
888-270-4460
For ages 8 and up

U.S. Dogs offers plush stuffed dogs that come with accessories, board books, and a mission to give children a better understanding of pet ownership. Each dog is designed to move in hundreds of poses to encourage role-play and fun.

Walk-A-Pets
Darmos toys—$3.99
www.darmos.com
800-327-6674
For ages 3 and up

The simplicity of these toys allows children to create their own stories and expand their imaginations. They are available in multiple lines including aquatic, zoo, farmyard, marsh, canine, science and technolgy.



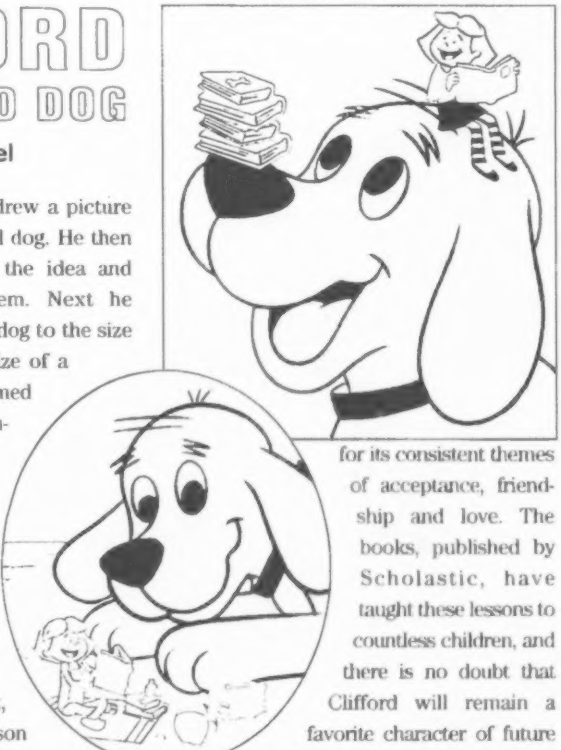
Whirly Wheels
Quantum Toys—$59.95
www.quantumtoys.com
info@quantumtoys.com
For ages 3-7

Whirly Wheels is a low-to-ground ride-on toy that provides fitness for young riders. Children rotate the handles of one or both wheels to turn, spin in a circle or go straight. With this toy, children can strengthen their arms and chest and improve coordination. A fun way for kids to have fun while staying in shape.

MEDIA REVIEW

CLIFFORD
THE BIG RED DOG

by Laura Apel



In 1962, Norman Bridwell drew a picture of a little girl with a big red dog. He then decided to continue with the idea and wrote a story about them. Next he enlarged the picture of the dog to the size of a horse, and then the size of a house. Bridwell's wife named the dog Clifford and the couple named the little girl Emily Elizabeth, after their own daughter. Forty years and nearly 100 million books in-print later, Clifford The Big Red Dog is celebrating his anniversary with a special edition of the book, and going into the third season of his award-winning, number one rated PBS KIDS television show. Nevertheless, regardless of all his achievements, Clifford simply remains the big red dog that two generations of kids have fallen in love with.

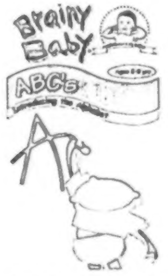
EP Magazine has chosen to recognize Clifford The Big Red Dog as a classic among literature for children throughout the world for its consistent themes of acceptance, friendship and love. The books, published by Scholastic, have taught these lessons to countless children, and there is no doubt that Clifford will remain a favorite character of future kids everywhere.

Everyone remembers reading about Clifford. The red dog who grew to the size of a house when he was still only a puppy has captured the hearts of children and parents alike since his first book was published. His size got him into trouble time and time again as he always seemed incapable of controlling his large and awkward body. Like other dogs, Clifford sometimes chased cars or dug up flowers, but his mistakes and messes were always far greater with much worse consequences.

For this reason, children with disabilities may find themselves relating to the red dog in ways that are unique to them and their feelings, fears and struggles. Throughout the stories of Clifford's many adventures and mishaps, he is teased and ridiculed for his size, color and clumsiness. Children learn from Clifford's experiences that although they may be different, that does not mean that they are not special and worth being friends with. Clifford always manages to overcome the obstacles that come before him, and in the end he has the support of those who know and love him.

On this 40th anniversary of our friend Clifford, EP Magazine would like to thank Norman Bridwell and his lovable character Clifford and praise them for standing out in children's literature as a series that has employed valuable themes that will continue to resonate with future generations of child readers everywhere.

For more information on where to find Clifford The Big Red Dog books and memorabilia and for information on the hit television show, please visit www.scholastic.com.



Brainy Baby ABCs video

Brainy Baby company—$15.95
www.brainybaby.com
800-664-4594
For ages 2-5

With this video, a child is introduced to the alphabet. Upper and lower-case letters are taught, as well as multiple letter-sounds. It is a comprehensive and entertaining video that can aid in learning letters.

First Impressions
Letters

First Impressions "Letters" video

Small Fry Productions—$15.95
www.small-fry.com
800-521-5311
For ages 1-5

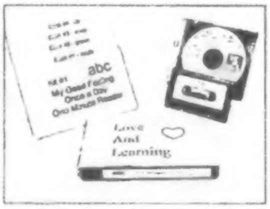
Prepare your child for the alphabet with First Impressions "Letters", a video that will enhance your child's desire to learn through fun-filled exercises. The video develops early-learning skills by associating letters with familiar objects, animals, toys and children. With the help of friendly voices and happy music, the video will introduce your child to the wonderful world of the ABCs.

First Impressions
Shapes

First Impressions "Shapes" video

Small Fry Productions—$15.95
www.small-fry.com
800-521-5311 • For ages 1-5

This video shows your child the fascinating world of shapes. Through several fun-filled exercises, your child can learn to find his/her way around basic everyday shapes from squares to circles to triangles.



Love and Learning Videotapes

Love and Learning—$63
www.loveandlearning.com
313-581-8436
For ages 6 months and up

With the Love and Learning kits, your child can be introduced to reading at a very fast pace. There are three parts to each learning kit. An audiotape works on vocalization and is played at naptime, bedtime or playtime and lets the child hear the words spoken in a clear, slow manner. A videotape repeats the same words visually and phonetically, again in a clear, focused presentation. Special books clearly present the same letters/words and, when used for just a few minutes each day, provide a special time for parent and child to read together.

Signing Time. Volume I: My First Signs VHS

Two Little Hands Productions—$14.95
www.signingtime.com
801-571-2445
For ages 0-5

From their magical animated world, Alex (who can hear) and Leah (who is deaf) invite infants and children to "come sign with us." Watch and enjoy as Alex, Leah, and their friends of varying ages illustrate American Sign Language (ASL) in a fun and playful way. This thirty-minute video explores eighteen child-friendly signs and exposes kids to many more through two original songs.

Team Xtreme

Pathways Development Group, Ltd.—$349.00
www.pathwaysdg.com
877-742-4604

Team Xtreme is a video game interface that adapts Nintendo, NES, Super NES and N64 game systems for people with disabilities. This new adaptation is not just for fun. The skills encouraged through its use allow people to learn how to use switches, work on hand-eye coordination, motor skills and mental and physical endurance. The interface also allows children to build new friendships while playing with peers, whether or not they have special needs. Models for games released in 2002 are also being prepared by the company.

Created by Mike Andrews, the unit meets the strict standards set by Nintendo and has numerous safety features including latex-free casing and overlay links, very low leakage currents on switch inputs and protection against static damage. According to the manufacturer, green and yellow lights are used instead of flashing red lights to help avoid possible seizure inducements.

EP'S TOY LADY

by Maria Tortoreto

Donna Caroccia is a lucky lady. She goes to work with a smile on her face every day, and leaves without ever changing expressions. But then again, how can she not smile when her job is to play with toys and children all day?

As EP Magazine's official "Toy Lady," Donna gives us new ideas and we in turn give her new toys for her preschool classes. For the past ten years, she has been a preschool teacher for disabled students at the Bergen Boulevard School in Ridgefield, New Jersey, where the curriculum consists solely of playing with toys.

"The children learn by playing," she explains. "It teaches them new skills and how to cooperate."

Donna came to EP Magazine about five years ago in search of new ideas for her classes, and we gave her an assignment: to be our "Toy Lady." As companies send us samples of new toys which could possibly be appropriate for children with disabilities, we give them to her to test out with the children. After all, children themselves are the best testers of toys!

Donna and her students have become a routine part of our magazine production for the October "toy issue" of EP. All year long, Donna collects the toys and sends them home for a few days with each child along with a survey for the parent to fill out. She then makes a list and returns it to us, giving us ideas for good toy nominations and allowing us to respond to the companies that send toys to us.

As a mother of two daughters, now ages 20 and 17, Donna was able to study typical child development when they were growing up. Using that as a guide, she knows where children should be in various stages and distributes toys to her preschoolers appropriately.

Donna is certified in special-needs teaching for grades K-8, and has a master's degree as a learning disabilities teacher-consultant. Donna has been helping young children to grow and expand their horizons for years, and as she moves on next year to second-through-sixth grade classes, she will take her passion with her.

For more information on these and other fun books contact the EP Library online (http://www.eplibrary.com), by fax (201-947-9376) or by calling (800) 535-1910.

She's Got The *Beat*

By Jennifer Kirby & Lori Ostrover

Star Anthony, her husband Larry Greenstein and their two sons Kevin and Thomas.

When Dr. Star Anthony and her husband, Larry Greenstein, welcomed their new baby boy Kevin into the world ten years ago, they didn't know that a new career for Anthony would be born as well. Interactive Metronome (IM), a computer-based training program that uses sound as a means of improving one's timing, is now being used as therapy for people with disabilities. Anthony has been an IM trainer since February of 2001.

Kevin was born with mild cerebral palsy, fine and gross oral motor issues and a visual disability, Anthony explains. "We knew right away that he was going to have issues, so we began seeking out appropriate treatment for him at an early age."

At first, they enrolled their then-eight-month-old in an early intervention program, but soon discovered it was not addressing his needs. Determined to find a treatment program that would, Anthony and her husband began investigating several early childhood development programs near their Port

continued on page 46

What is Interactive Metronome? The process includes the use of a set of headphones and computer software, along with hand- and foot-sensing triggers. One sensor consists of Velcro wrapped around the hand, and the other is a flat pad on which the foot can tap. Both devices have sensors inside which click, then send messages to the computer.

The user first undergoes a long form test. Under the guidance of an IM trainer, they listen for the beat produced by the IM computer software. After hearing it, they must anticipate the next beat by tapping one of the sensing triggers. Meanwhile, the IM program measures how much ahead or behind the user is to that beat in milliseconds. The closer someone is to the beat, the better their timing and the lower their score. By examining the milliseconds read by the computer, the IM provider is then able to design an appropriate program for that individual so they may improve their timing.

The program typically consists of 15 one-hour sessions over a three- to five-week period. Short tones can be added to the original beat to tell the user how far ahead or behind they are from the original beat, which sounds a bit like a cow bell. This helps users to accurately correct their timing. According to IM inventor/senior vice president, research and product development, Jim Cassily, the program can also be used by those with hearing impairments because the beat's vibrations can be felt through the headphones.

It is important to note that IM is not a cure, but a learning enhancement tool. It is for those children and adults who have attention and/or motor control/coordination problems, learning disabilities, traumatic brain injuries, cerebral vascular injuries (stroke), Parkinson's disease or autistic spectrum disorder.

BEST COPY AVAILABLE

The History OF IM

When musician/record producer Jim Cassily had his own recording studio in Ann Arbor, Michigan during the 1960s and 70s, he noticed that some musicians had natural timing, while others did not. "We call it the 'cook,'" he explains.

Although Cassily had used traditional metronomes—a pendulum-like instrument used to help musicians keep a steady tempo by listening to a click—he realized that in order to teach cook he'd have to make it interactive for two reasons. First, the regular metronome doesn't let you know if you're ahead or behind the beat. Second, the instrument acts as an anchor, because when musicians play with a person or group, they have a tendency not to listen or work with the other tempos.

In 1993, Cassily used a large box, complete with a built-in dedicated computer processor, and several pieces of professional audio processing equipment to create an interactive metronome. He began training several musicians. By chance, a doctor asked Cassily to try this new process on his friend, who had been in a car accident that resulted in brain injury. Cassily's additional background in child psychology made him eager to try it on children who had a variety of special needs, and did this with the help of Easter Seals. One of his first students was an eight-year-old named Jimmy Eggleston.

The young boy was born with no right leg, dislocated hips, no ligaments in his left knee, severe scoliosis and a diaphragmatic hernia which kept his lungs from fully developing. He also had a trache and oxygen tank and was unable to swallow whole food for the first five years of his life. "My wife is a pediatrician and had taken piano herself for a few years. She knew of the developmental value of music training and we both observed Jimmy's interest in music, so we thought lessons would be good for him," explains Jimmy's dad, Tom.

And so in the summer of 1994, before Jimmy was to enter the second grade, Cassily began working with him. By the third session, Tom and his wife Kathy began noticing a change—Jimmy's balance seemed to be improving. By the fifteenth session, Jimmy was able to walk without his walker. They also saw improvements in his piano playing, coloring, handwriting and attentional problems.

Soon after, Cassily met a child with autism, with whom he wanted to begin IM Training, though that child had been seeing Dr. Stanley Greenspan on a bi-annual basis for several years, so his mother wanted to make sure it was all right with Dr. Greenspan before proceeding. Greenspan gave his okay and by the next time he saw the boy, which was in 1995, he was so pleased with the results that he immediately got in touch with Cassily, who asked him to come on board as the Chairman of IM's Scientific Advisory Committee.

Although the interactive metronome Cassily had originally envisioned became available in 1999, it has only recently become a focus of the media and special needs community. A published study on "The Effects of Interactive Metronome Training on Children With ADHD," which appeared in the March/April 2001 edition of The Amercian Journal of Occupational Therapy, has given a big boost to the product's credibility. It proved that timing is an important component for planning, sequencing and focusing, and that these things are indeed relative to attentional problems.

Tom Eggleston became impressed with this therapy, and wanted to get more involved. In January of 2001, he resigned as senior vice-president of e-commerce for AutoNation, Inc., a billion dollar company, to become IM's CEO. "I have a real passion that this tool can touch and reach the lives of children as it has our own son," he says.

Today, IM is used in over 600 clinics, schools and hospitals. Eggleston hopes that network continues to grow, particularly in the realm of geriatrics, where he hopes IM will help elderly people regain their functioning. Dr. Greenspan, who retains his private practice in Bethesda, Maryland, sees continuing ambitious research as part of the future. Currently, studies are being done on Parkinson's disease, as well as unexceptional students and professionals.

continued from page 45

Washington, Long Island home. Subsequent to speaking with several of these program's directors, one director in particular suggested they get in touch with renowned child psychiatrist and author, Dr. Stanley Greenspan.

Greenspan currently has a practice in Bethesda, Maryland, where he works with a wide range of children. The 30-year medical veteran developed an interest in children who have special needs at the National Institutes for Mental Health.

Anthony and her husband became very impressed with Greenspan after reading his books and reviewing his credentials. They immediately set up an appointment for Kevin, and eight years later they still depend on him for guidance when it comes to their ten-year-old son.

Last spring, Greenspan suggested that Anthony and her husband should treat their son's physical, occupational and speech therapy difficulties, to name a few, through IM. Anthony and her husband immediately began looking into it, and learned why it was successful in helping to develop attentional and motor skills.

Timing May Really Be Everything

Recent research (particularly the study on "The Effect of Interactive Metronome Training on Children With ADHD," published in the March/April 2001 issue of The American Journal of Occupational Therapy) has shown that timing is a very important component of human development. It affects the ability to plan and sequence actions, which are both related to cognitive and physical achievement.

Greenspan explains, "Timing affects many areas of learning: the ability to write an essay, tie your shoes, sequence your ideas and

BEST COPY AVAILABLE

socialize. These things all require some sequencing and planning." By exercising one's capacity for rhythmicity and timing, planning and sequencing improve and progress can be made in academics, motor skills and more.

It is important to note that IM is not a cure, but a learning enhancement tool. It is for those children and adults who have attention and/or motor control/coordination problems, learning disabilities, traumatic brain injuries, cerebral vascular injuries (stroke), Parkinson's disease or autistic spectrum disorder.

Becoming an IM Trainer

Anthony and her husband did their research, came across a trainer on IM's web site, and took Kevin in for his

Jim Casslly, the inve[illegible] of IM, demonstrating how the program works.

Do you or someone you know have ADHD?

If you or someone you know experiences one or more of the following challenges often displayed by those who have ADHD, you may be interested in a breakthrough technology program called Interactive Metronome® (IM).

__ **Poor Coordination**

__ **Difficulty with language processing**

__ **Aggressive behavior**

__ **Difficulty focusing/concentrating**

__ **Difficulty with reading fluency**

Findings from a double blind, placebo controlled study on subjects diagnosed with ADHD showed those who completed the IM program saw improvements in attention, coordination, control of aggression, reading and language processing. This study was peer reviewed and published in the *American Journal of Occupational Therapy*.

Interactive Metronome is a non-invasive software program proven to produce significant gains in all of the above areas in just 3-5 weeks. This innovative technology program is available through your local health-care provider. To find an IM provider in your area, log onto **www.interactivemetronome.com** .

interactive metronome

continued from page 47

initial assessment. The service provider wasn't sure exactly how much pre-training Kevin would need since his scores were outside the program's starting point. Anthony soon decided she wanted to be Kevin's trainer herself.

There are different kinds of IM service providers, and IM has strict provider qualifications in the area of healthcare. Once your credentials are deemed appropriate and you've undergone the essential training program, you can then order the package for $2700. Anthony was able to become an IM healthcare provider due to her 12-year background as a chiropractor, and she now holds the title of Clinical IM Trainer. For non-healthcare-related applications, a professional background is not required.

Anthony confesses, "Kevin is still in pre-training, but it's getting there. People at technical support and people I met at a recent IM conference have given me ideas on how to adapt the exercises to his special needs." For instance, because of his balancing difficulties, he often does the exercise lying down. Anthony's IM practice seems to be evolving.

Fellow Port Washington resident Andrea Scharf decided to put son Jamie, a classmate of Kevin's, into IM training with Anthony after the two spoke about it. "Jamie is classified as learning disabled. He's been receiving speech therapy since he was 17 months old and occupational therapy at about 26 months old, and he still receives both in school," Scharf explains. "We started his training in April of 2002 and he had more than 15 sessions, because he needed two or three pre-training sessions. I think [IM] definitely helped. With academics, there was less frustration and breaking down and while Jamie has always been a strong reader, I noticed an increase in his concentration on what he was reading." In addition, Scharf has also seen an increase in her son's gross motor skills on the baseball diamond.

Noting improvements Anthony sees in kids like Jamie inspires her to move away from her chiropractic vocation and concentrate more on her IM training. She claims, "A lot of these kids are not used to succeeding in things, but they gain a great deal of self-confidence through doing this because it is hard and challenging. You're learning something new and you're working hard at it and that's why I love it."

The Center for DISCOVERY

The Center for Discovery is certified by New York State through the State Education Department, the Department of Health and the Office of Mental Retardation and Developmental Disabilities (OMRDD); and by the Commission on Accreditation of Rehabilitation Facilities (carf).

Visit us at Booth #730 at The World Congress & Exposition on Disabilities in Orlando, Florida — October 3-5, 2002

Please read the four-part series, "Transitions: Informing, Empowering and Keeping Parents Involved," (June through September) currently appearing in Exceptional Parent Magazine.

Don't miss the special presentation, "Transitions: Informing, Empowering and Keeping Parents Involved," at the WCD (Oct. 4, at 2:00 p.m.) that will address the issues raised in the four-part EP series.

Be sure to attend the presentation at the WCD (Oct. 3, at 3-5 p.m.) highlighting the outcomes of The Center for Discovery's International Summit, entitled "Disabilities: Sharing Visions for the Future" that was held at The Center this past June.

The Center for Discovery, a nationally-renowned prep school for children with significant disabilities (including multiple disabilities, medical frailties and some behavioral concerns) recently opened several new, small, universally-designed residences.

Located near Monticello, NY in the picturesque Catskill Mountains, just two hours northwest of New York City, The Center features a nature-based program that challenges children, and their families, to work with us to provide the finest educational, clinical, social and residential opportunities available anywhere.

We may just be
the right program
for your child.

Call our Admissions Office at (845) 794-1400, extension 1444 for information and/or to arrange a personal tour and see *discovery* in action.

PRACTICE PARAMETER: Screening and diagnosis of autism

Report of the Quality Standards Subcommittee of the American Academy of Neurology and the Child Neurology Society

EP Magazine will be exploring the causes, effects and treatment of autism through 2003. As a basis for planning these articles, and to invite comment and contributions, we are publishing the "Practice parameter: Screening and diagnosis of autism" from the report of the Quality Standards Subcommittee of the American Academy of Neurology and the Child Neurology Society.

Level one: routine developmental surveillance and screening specifically for autism.

Analysis of the evidence. **When and how often should developmental surveillance/screening be performed?** Approximately 25% of children in any primary care practice show developmental issues. However, fewer than 30% of primary care providers conduct standardized screening tests at well-child appointments. The American Academy of Pediatrics (AAP) stresses the importance of a flexible, continual developmental surveillance process at each well-child visit, and recommends eliciting and valuing parental concerns, probing regarding age-appropriate skills in each developmental domain, and observing each child.

What are the appropriate developmental screening questionnaires that provide sensitive and specific information? Developmental screening tools have been formulated based on screening of large populations of children with standardized test items. Sensitive and specific developmental screening instruments include: the Ages and Stages Questionnaire, the BRIGANCE Screens, the Child Development Inventories and the Parents' Evaluations of Developmental Status.

The Denver-II (DDST-II, formerly the Denver Developmental Screening Test-Revised) has been the traditional tool used for developmental screening, but research has found that it is insensitive and lacks specificity. The Revised Denver Pre-Screening Developmental Questionnaire (R-DPDQ) was designed to identify a subset of children who needed further screening. However, studies have shown that it detected only 30% of children with language impairments and 50% of children with mental retardation.

How are conventional developmental milestones defined? Conventional developmental language milestones are based on normative data from numerous standardized language instruments for infants. Lack of acquisition of the following milestones within known accepted and established ranges is considered abnormal: no babbling by 12 months, no gesturing (e.g., pointing, waving bye-bye) by 12 months; no single words by 16 months; no 2-word spontaneous (not just echolalic) phrases by 24 months; and any loss of language or social skills at any age. Failure to meet these milestones is associated with a high probability of a developmental disability.

Do parents provide reliable infor-

mation regarding their child's development? Several studies encompassing 737 children showed that parental concerns about speech and language development, behavior, or other developmental issues were highly sensitive (i.e., 75% to 83%) and specific (79% to 81%) in detecting global development deficits. However, the absence of such concerns had modest specificity in detecting normal development (47%). An additional study that combined parental concern with a standardized parental report found this to be effective for early behavioral and developmental screening in the primary care setting.

Can autism be reliably diagnosed before 36 months of age? Because there are no biological markers for autism, screening must focus on behavior. Recent studies comparing 109 autistic and 33 typically developing children demonstrated that problems with eye contact, orienting to one's name, joint attention, pretend play, imitation, nonverbal communication, and language development are measurable by 18 months of age. These symptoms are stable in children from toddler age through preschool age. Retrospective analysis of home videotapes has also identified behaviors that distinguish infants with autism from other developmental disabilities as early as 8 months of age.

Current screening methods may not identify children with milder variants of autism, those without mental retardation or language delay, such as verbal individuals with high-functioning autism and Asperger's disorder, or older children, adolescents, and young adults.

Is there an increased risk of having another child with autism (recurrence)? The incidence of autism in the general population is 0.2%, but the risk of having a second (or additional) autistic child increases almost 50-fold to approximately 10 to 20%.

What tools are available with appropriate psychometric properties to specifically screen for autism? Appropriately sensitive and specific autism screening tools for infants and toddlers have only recently been developed, and this continues to be the current focus of many research centers. The Checklist for Autism in Toddlers (CHAT) for 18-month-old infants, and the Autism Screening Questionnaire for children 4 years of age and older, have been validated on large populations of children. However, it should be noted that the CHAT is less sensitive to milder symptoms of autism, as children later diagnosed with PDD-NOS, Asperger's, or atypical autism did not routinely fail the CHAT at 18 months.

The Pervasive Developmental Disorders Screening Test-II (PDDST-II) for infants from birth to 3 years of age, the Modified Checklist for Autism in Toddlers (M-CHAT) for infants at 2 years of age, and the Australian Scale for Asperger's syndrome for older verbal children, are currently under development or validation phases.

What screening laboratory investigations are available for developmental delay, with or without suspicion of autism? *Formal audiologic evaluation.* The Committee on Infant Hearing of the American Speech-Language-Hearing Association developed guidelines for the audiologic assessment of children from birth through 36 months of age. They recommended that all children with developmental delays, particularly those with delays in social and language development, have a formal audiologic hearing evaluation. Three studies have documented that conductive, sensorineural, or mixed hearing loss can co-occur with autism, and that some children with autism may be incorrectly thought to have peripheral hearing loss. In addition, transient conductive hearing loss associated with otitis media with effusion can also occur in children with autism.

Audiologic assessment of such children requires modifications of traditional test techniques and environments (e.g., operant test procedures). Electrophysiologic procedures are useful for estimating hearing sensitivity and for examining middle ear, cochlear, and VIIIth nerve or auditory brainstem pathway integrity. Evoked otoacoustic emissions are useful for examining cochlear (sensory) function, and is a frequency-specific, as well as a time-and cost-efficient procedure. Frequency-specific auditory brainstem response (ABR) is the single most useful electrophysiologic procedure for use in estimating hearing thresholds, and has been demonstrated to be highly correlated with behavioral hearing thresholds in children who hear normally and in children who have sensorineural hearing loss.

Lead screening. Children with developmental delays who spend an extended period in the oral-motor stage of play (where everything "goes into their mouths") are at increased risk for lead toxicity, especially in certain environments. The prevalence of pica in this group can result in high rates of substantial or recurrent exposure to lead. The National Center for Environmental Health of the Centers for Disease Control and Prevention recommends that children with developmental delays, even without frank pica, should be screened for lead poisoning. Blood levels in children with autism are elevated . In one study, the mean blood lead level in 18 autistic children was higher than in 16 nonautistic "psychotic" children or in 10 normal siblings; 44% of the autistic and psychotic children had lead levels significantly above the mean compared with control subjects. In a more recent study, 17 autistic children treated for lead poisoning were compared with 30 children without

continued on page 52

continued from page 51

autism. The autistic children were older at diagnosis, had higher lead levels, and most were reexposed despite close monitoring of their environment.

Level two: diagnosis

and evaluation of autism. *Analysis of the evidence.* **Who should diagnose autism?** Although educators, parents, and other health care professionals identify signs and symptoms characteristic of autism, a clinician experienced in the diagnosis and treatment of autism is usually necessary for accurate and appropriate diagnosis. Clinicians must rely on their clinical judgment, aided by guides to diagnosis, such as DSM-IV and the Tenth Edition of the International Classification of Diseases (ICD-10), as well as by the results of various assessment instruments, rating scales, and checklists. These instruments and criteria should be used by practitioners not as experienced in the diagnosis of autism.

What are the medical and neurologic concerns in evaluating children with autism? *Family prevalence.* Family studies have shown that there is a 50-fold to 100-fold increase in the rate of autism in first-degree relatives of autistic children. Within these families, there are also elevated rates of social difficulties; higher incidences of cognitive, communication, learning and executive function deficits; increased stereotyped behaviors; and anxiety, affective, language, and pragmatic disorders. Monozygotic twin pair studies have also shown a high concordance rate (60%) for DSM-IV Autistic Disorder, 71% for the broader autistic spectrum phenotype, and 92% for an even broader phenotype of social and communication deficits with stereotyped behaviors that nonetheless were clearly differentiated from normal. In contrast, no concordance for autism was noted in dizygotic twin pairs and only 10% were concordant for some form of cognitive, social, or language deficit.

Large head circumference without frank neuropathology. Children with autism have a larger head circumference; only a small proportion have frank macrocephaly. Large head size may not necessarily be present at birth, but may appear in early to mid-childhood, perhaps indicating an increased rate of brain growth. Neuroimaging studies in autism also found larger brain volumes without associated neuropathology.

Association with tuberous sclerosis complex (TSC) and less often with Fragile X (FraX) syndrome. Seventeen to over 60% of mentally retarded individuals with TSC are also autistic, and these patients commonly have epilepsy. In contrast, the number of autistic individuals with TSC has been estimated to be between 0.4% and 3%. This rate increases to 8% to 14% if epilepsy is also present.

Clinical studies report that 3% to 25% of patients with FraX have autism. However, no evidence of FraX in autistic individuals was found using cytogenetic (not DNA analysis) techniques; with molecular genetic analyses, only a few autistic individuals were shown to have FraX.

What are the specific deficits of the autistic child's developmental profile? *Speech, language, and verbal and nonverbal communication.* Verbal and nonverbal communication deficits seen in autism are far more complex than simple speech delay, but overlap with developmental language disorders or specific language impairments. Expressive language function ranges from complete mutism (as often seen in children 2 to 3 years of age) to verbal fluency, though verbal abilities are often accompanied by many errors in word meaning (semantics) or language and communicative deficits in social contexts (social-pragmatics).

Cognitive deficits. Many autistic individuals demonstrate a particular pattern on intellectual tests that is characteristic of autism, i.e., performance IQ (PIQ) higher than verbal IQ (VIQ), and specific intersubtest scatter, with Block Design typically the highest subtest and Comprehension usually the lowest. However, the PIQ-VIQ split is severity dependent. When Full Scale IQ (FSIQ) and VIQ are both above 70, 80% of autistic individuals will have no significant VIQ-PIQ disparity, and the remainder are evenly divided between those with PIQ > VIQ and those with PIQ < VIQ.

The DSM-IV defines the diagnosis of mental retardation as the combination of subaverage intellectual functioning (IQ> 70) and concurrent deficits in adaptive functioning. Autistic individuals have poorer adaptive function than would be predicted by IQ alone.

Sensorimotor deficits. Impairments of gross and fine motor function are reported as being common in autistic individuals, and are recognized as hypotonia, limb apraxia, or motor stereotypies. Motor deficits are more severe in individuals with lower IQ scores. Hand or finger mannerisms, body rocking, or unusual posturing are reported in 37% to 95% of individuals, and often manifest during the preschool years. Sensory processing abilities are aberrant in 42% to 88% of autistic individuals and include preoccupation with sensory features of objects, over- or under-responsiveness to environmental stimuli, or paradoxical responses to sensory stimuli.

Neuropsychological, behavioral, and academic impairments. Specific neuropsychological impairments can be identified, even in young children with autism, that correlate with the severity of autistic symptoms. Performance on tasks that rely on rote, mechanical, or perceptual processes are typically spared; deficient performance exists on tasks requiring higher-order conceptual processes, reasoning, interpretation, integration, or abstraction. Dissociations between simple and complex processing are reported in the areas of language, memory, executive function, motor function, reading, mathematics, and perspective-taking. There is no reported evidence that confirms or excludes a diagnosis of autism based on these cognitive patterns alone.

When and what laboratory investigations are indicated for the diagnosis of autism? *Genetic testing.* A chromosomal abnormality reported in possibly more than 1% of autistic individuals involves the proximal long arm of chromosome 15 (15q11-q13), which is a greater frequency than other currently identifiable chromosomal disorders. Those with the 15q abnormalities typically have moderate to profound mental retardation. The duplication is usually maternally inherited, either pseudodicentric 15 (inverted duplication 15) or other atypical marker chromosomes, with one or two extra copies of the area roughly corresponding to the typical Angelman syndrome (AS)/Prader Willi syndrome (PWS) deletion region of approximately four million base pairs. Conversely, AS is usually due to a deletion of maternally inherited 15q11-q13 material and has been found in patients with autism and profound mental retardation.

Metabolic testing. Inborn errors in amino acid, carbohydrate, purine, peptide, and mitochondrial metabolism, as well as toxicologic studies, have been studied, but the percentage of children with autism who have a metabolic disorder is probably less (and some experts agree that it is considerably less) than 5%

Electrophysiologic testing. The prevalence of epilepsy in autistic children has been estimated at 7 to 14%, whereas the cumulative prevalence by adult-

1157

continued from page 53

hood is estimated at 20% to 35%. Seizure onset peaks in early childhood and again in adolescence. Mental retardation, with or without motor abnormalities and family history of epilepsy, was a significant risk factor for the development of seizures in autistic individuals.

It is unclear whether there is a relationship between autism and an early regressive course (before 36 months), childhood disintegrative disorder ([CDD] after 36 months), Landau-Kleffner syndrome, and electrical status epilepticus during slow wave sleep (ESES). Autism with regression and CDD have both been associated with seizures or epileptiform sleep-deprived EEG (with adequate sampling of slow wave sleep). A higher incidence of epileptiform EEG abnormalities in autistic children with a history of regression has been reported when compared to autistic children with clinical epilepsy. Seizures or epileptiform discharges were more prevalent in children with regression who demonstrated cognitive deficits. Regression in cognition and language in adolescence associated with seizure onset has also been observed, but little is known about its cause or prevalence. There may be a causal relationship between a subgroup of children with autistic regression and EEG-defined "benign focal epilepsies." There is insufficient evidence to suggest a role for event-related potentials or magnetoencephalography in the evaluation of autism.

Neuroimaging. CT studies, ordered as standard assessments of children diagnosed with autism during the 1970s and 1980s, reported a wide range of brain imaging abnormalities and suggested that there was an underlying structural disorder in patients with autism. This view changed when Damasio et al. demonstrated that such abnormalities were incidental to coexisting anatomic disorders unrelated to autism. A very low prevalence of focal lesions or other structural abnormalities was found; their inconsistent localization marked them as coincidental. Prevalence of lesions on MRI in children with autism is similar to normal control subjects. CT and MRI studies of autistic subjects screened to exclude those with disorders other than autism confirmed the absence of significant structural brain abnormalities.

Functional imaging modalities such as functional MRI (fMRI), single-photon emission CT (SPECT), or positron-emission tomography (PET) are currently only research tools in the evaluation of autism. There is no evidence to support a role for functional neuroimaging studies in the clinical diagnosis of autism at the present time.

Other tests. There is insufficient evidence to support the use of other tests such as hair analysis for trace elements, celiac antibodies, allergy testing (particularly food allergies for gluten, casein, candida, and other molds), immunologic or neurochemical abnormalities, micronutrients such as vitamin levels, intestinal permeability studies, stool analysis, urinary peptides, mitochondrial disorders (including lactate and pyruvate), thyroid function tests, or erythrocyte glutathione peroxidase studies.

Summarizing Alternative Treatments
FOR AUTISM AND OTHER DEVELOPMENTAL DISORDERS

By Laura Apel

The search for effective treatments can be difficult and exhausting for parents whose children suffer from autism and other developmental disorders. Successful, non-drug approaches that many parents may not realize can be among their options are examined by Dr. Lewis Mehl-Madrona. Throughout this report, "Alternative and Innovative Therapies for Developmental Disorders," which is available on line at http://www.eparent.com, the importance of basic and enjoyable acts of love, attention and enthusiastic high expectations is stressed.

Many observers believe drug therapies do not significantly improve the condition of the child, which has left parents searching elsewhere for any answer to what can be done to help. Dr. Mehl-Madrona has spent a great deal of time and research on providing these parents with possible answers to their dilemma and his report furnishes readers with a plethora of information.

As a preface to his list of possible alternative methods Dr. Mehl-Madrona explains that there has not yet been definitive evidence to support any single cause of autism, and that because of this no exact cure has been produced. However, he began his research and compilation after parents of children with autism brought several factors to his attention.

They included the observation that children with developmental disorders could be accessed through astonishingly simple actions such as:

- being paid attention to;
- being cared for;
- being massaged;
- being placed on special diets.

From this, he deduced that it was possible for these children to eventually become indistinguishable from those who did not have the disorder.

The therapies that Mehl-Madrona recommends range from simple behavioral changes such as increased enthusiasm and a higher level of expectations by parents and doctors regarding the child's potential, to more complex dietary approaches including a gluten/casein free diet that requires an elimination of all grains, soy and dairy from the child's meals. This particular dietary change as a treatment is based on the theory that autism might be caused by an elevated level of opiates, which are present in gluten/casein proteins. Most parents are simply not aware that something as common as the removal of milk from their child's everyday diet could eventually prove beneficial to improving their symptoms.

Dr. Mehl-Madrona also discusses the role that metabolic abnormalities have in autism, and the effect that nutritional therapies may play in the improvement of a child's condition. Once metabolic consequences of an enzyme defect are recognized and defined, the child's symptoms can be treated with specific dietary changes, drugs and/or nutritional supplements.

The author goes into great detail about the reasons for and benefits of particular vitamins and then recommends a basic supplement program including, "vitamin C, trace minerals (vanadium, germanium, selenium, tungsten, tin, etc.), common minerals (zinc, manganese, magnesium, calcium), B vitamins (with extra thiamin, B6, and B12), vitamin A, evening primrose oil, marine lipids, OPC-3's and vitamin E."

Also discussed in depth are the effects that environmental toxins, such as pesticides and herbicides, may have on genetically vulnerable individuals with autism. The suggestion is made that early exposure to synthetic chemicals, coupled with impaired liver detoxification, could be responsible for the increase in the incidence of autism that has recently developed.

Related to this theory is the impaired sulfate metabolism theory of autism, in which the impairment of the acid affects the detoxification process, causing degenerative neurological and immunological conditions. Environmentally acquired mercury is also thought to be a possible cause of autism based on the idea that it causes immune, sensory, neurological, motor and behavioral dysfunctions that are commonly associated with autism. This form of mercury can be contracted from vaccinations or simple casual contact. As treatment, Dr. Mehl -Madrona suggests the application of chelating agents to remove the toxic agents.

Environmentally acquired mercury is also thought to be a possible cause of autism based on the idea that it causes immune, sensory, neurological, motor and behavioral dysfunctions that are commonly associated with autism.

The hormone secretin is also proposed as an alternative therapy where dramatic improvement has been documented in some children who have received specific doses. Treatment of children with autism with anti-viral therapy can be beneficial when used to treat the signs of long term or chronic viral infection.

Children with autism may have defects in their immunity, so Dr. Mehl- Madrona also addresses the subject of immunotherapy, and the treatment with intravenous immunoglobulin G. Children with chronic viral infections and other immune deficiencies have are believed by some to benefit from the therapy where Vitamin C, oligoprocyanidins and anti-inflammatory fatty acids are also mentioned as possible cohabitants against the condition.

Homeopathy is a controversial treatment used in the treatment of the signs of autism, but one that Dr. Mehl-Madrona has found effective in his personal experience. In this approach small amounts of toxic substances are used in an attempt to stimulate the body to heal from these substances. Dietary modifications are recommended in order to facilitate the release of toxins, such as alkanizing agents like spinach, cucumber, carrot, beets and celery, and avoiding tomatoes, red meats and other acidic foods.

Another approach discussed is the effect of body therapy and manipulative therapies on children with autism A recent study compared children who received 15-minute massages prior to bedtime and children who were read Dr. Seuss stories by their parents at bedtime. Members of the massage therapy group exhibited less stereotypical behavior and more on task and social relatedness behavior during observations at school.

Craniosacral therapy, where the bones of the skull and the spine are adjusted, and chiropractic manipulation are also mentioned as having positive outcomes. In addition, the simple and rewarding act of holding a child with autism is reported to improve social interaction and responsiveness.

Sensory integration therapy, in which the child receives multiple, simultaneous stimuli from different sensory modalities in an attempt to harmonize these miscellaneous inputs, is also discussed. Simultaneous communication and multisensory input aimed at alleviating the children's difficulties in information processing, organization of experience, and affect is also examined, but results in this area are preliminary at best.

The report concludes with a discussion of three forms of psychological and behavior therapies used in the treatment of children with autism.

The first is the technique of adult imitative behavior as an early intervention.

Next is the use of music as a therapy, which has been shown to have an easing and therapeutic effect with some children.

Finally, naturalistic behavior therapy, in which the child is taught specific skills through interaction in particular trials where the correct response is rewarded, is discussed. The key aspect of this approach, as described by Dr. Mehl-Madrona, is that the child should be placed in natural situations where there will be the opportunity to be rewarded for what he or she already enjoys taking part in.

Doctor Mehl- Madrona addresses notes that, although drug therapies can be helpful, his intent is to present to parents who are dissatisfied with medications, alternative therapies that can aid in the treatment of a child with autism Throughout the discussion of the many methods that can be utilized, the report repeatedly emphasizes the simplicity involved in some basic and effective fundamentals of childcare, that may be trivialized by even the most informed of parents. EP

Off-Label Use of Pharmaceuticals

By Julia Steele

Once the Food and Drug Administration (FDA) has approved a given drug as safe for one use, physicians are free to prescribe it for any condition. This is called "off-label" drug use, because drugs are being used for purposes other than those indicated in their labeling information (also called prescribing information or PI).

The reasons for growing off-label use are many.

Sometimes Doctor X will notice that a patient—or two or three or more—who has been prescribed a particular drug as treatment for condition A will also show improvement in condition B. The doctor might then prescribe the same drug to treat condition B only. If it seems to work, Doctor X will tell a few colleagues, who will then try the therapy. Information about positive outcomes might be the basis for a poster session at a major medical meeting and, thus, widely disseminated.

In treatment of cancer and other terminal illnesses, as much as 60 percent of the medication prescribed is off-label. Physicians want to help their patients, or at least ameliorate symptoms; the patients feel they have nothing to lose; and so they are both willing to try any treatment that might help. Also, because there are so many types of cancer, a drug approved for one cancer might be used off-label to treat another type of malignancy. For instance, use of a drug approved for one form of lung cancer to treat liver cancer is considered off-label.

In pediatrics, drugs are prescribed to treat the conditions for which they are approved in adults, but are classified as off-label because they have not been approved for use in children. Many drugs lack approval for kids simply because there is a shortage of children for clinical trials, perhaps because the parents don't know that a trial is underway for which their child might be eligible.. Children are not miniature adults; effective dosages are based on several factors besides height and weight. Thus a drug could be perfectly safe for minors, but without sufficient data the FDA will not approve a pediatric indication. In the past few years a program has been in place in which drugs tested and approved for pediatric indications are granted six more months of marketing exclusivity.

THE CENTER FOR CHILDREN • HOSPITAL FOR JOINT DISEASES

Caring for children with
Cerebral Palsy
requires the help of many specialists.

Now you can find them all at
one special place.

The Center for Children is the one place you'll find all the care options you need, with just one concern in mind: your child. By bringing together the resources of the Hospital for Joint Diseases (HJD) and the Rusk Institute of Rehabilitation Medicine (RIRM) of NYU Hospitals Center, we can care for a variety of conditions in one convenient setting. For example, you'll find the widest possible range of treatments for children with cerebral palsy, with in-house specialties including pediatric physiatry, orthopaedics, speech therapy, neurology, neurosurgery, physical and occupational therapy. All in a gentle, kid-friendly environment where there are no white coats, but plenty of color, interaction, toys, games and stimulation. From newborns to 21-year-olds, The Center for Children treats them better. **Call us at 212-598-2330.**

"off-label" drug use

continued from page 58

Meanwhile, physicians prescribe off label because they want to help their patients.

Doctors are now noticing that people with rheumatoid arthritis who take certain types of anti-inflammatory drugs—NSAIDs (nonsteroidal anti-inflammatory drugs) and COX inhibitors—have less colon cancer than the population as a whole. Thus, both categories are being tested for safe and effective use in colon cancer. A situation such as this could lead not only to new approvals, but also add to our knowledge of how certain diseases take form.

Another benefit to off-label prescribing is that it makes drugs available immediately. The FDA approval process for a new drug application (NDA) can take years to complete; approval for an additional indication, while faster, can also take many months or even years. This is a long time to wait for someone who has a severe condition that can be treated with off-label medication.

Sometimes drug companies choose to forgo the formality of FDA approval for additional uses when their products are widely recognized in the medical community as an effective method of treatment—this is often due to the enormous amount of time and money involved in seeking approval. But there are benefits to be had by manufacturers seeking FDA approval. While drug companies are free to circulate third-party studies or articles supporting the off-label use of their products, the FDA stipulates that drugs may not be marketed or advertised for off-label uses. If the potential market and consequent economic benefits are large enough, a company might decide that it is worth the resources to apply for additional approval. Moreover, an approved new indication generally lengthens the period during which the pharmaceutical company has exclusive marketing rights for the product..

This was the case with finasteride, a drug that prevents the production of a male hormone called dihydrotestos-

While drug companies are free to circulate third-party studies or articles supporting the off-label use of their products, the FDA stipulates that drugs may not be marketed or advertised for off-label uses.

1164

Risperidone is quite often prescribed off-label to children to help control behavioral problems associated with conditions such as autism, ADD/ADHD and the depression associated with bipolar disorder.

terone (DHT). Finasteride was originally approved to treat the symptoms of prostate enlargement, but the drug was also discovered to limit male-pattern baldness. With the enormous market for hair-loss prevention therapies, the manufacturer decided to seek approval for the second purpose. Finasteride is now marketed as both Proscar and Propecia, one for each indication.

Treatment of neurological and psychiatric disorders often involves off-label uses. Many drugs approved for one condition affect the brain's behavior in ways that are useful for treating other conditions, and so are used for many purposes. Drugs such as fluoxetine (Prozac), a selective serotonin uptake inhibitor (SSRI) approved for treating depression, have also been approved to treat obsessive-compulsive disorder, panic disorder and chronic pain. These drugs are also used off-label to manage severe anxiety, ADD/ADHD and other neurological/psychiatric disorders.

One commonly prescribed psychotropic drug is risperidone (Risperdal). In addition to an approved use for treating schizophrenia in adults, it is widely used for treating schizophrenia in children and teenagers. Risperidone is quite often prescribed off-label to children to help control behavioral problems associated with conditions such as autism, ADD/ADHD and the depression associated with bipolar disorder. The FDA has not approved any drugs for the treatment of autism, but a large number of children with the disorder are helped by taking medication to control problems like aggression, hyperactivity and compulsive behavior. Risperidone is rapidly gaining attention for use in this area and is currently being studied in children with autism.

While off-label drug use can have many benefits, some drugs can also have unexpected side effects. The trick is to make them beneficial; a negative side effect in one situation may become a medical problem-solver in a different context. EP

CFRI
Conference

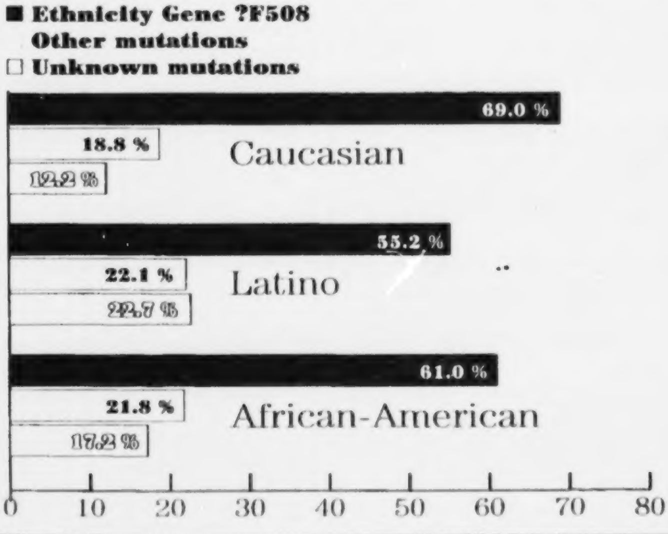
CFRI Cystic Fibrosis Research Inc.
help us save lives

By Jennifer Block Martin

When I went to the Cystic Fibrosis Research Inc. (CFRI) conference in San Jose, California, on August 10, 2002, I brought along my husband, Dave, who himself has cystic fibrosis. The women at the registration table all marveled at how healthy he looked and sounded and at his advanced age, 36. They gave him a name tag that proudly read "CF Adult."

Then one woman asked if Dave was cleared to attend. Each person with CF attending the conference is required to submit a medical release indicating that s/he has never tested positive for Burkholderia cepacia, has not tested positive for methicillin-resistant Staphylococcus aureus within the past two years and is currently not culturing any bacteria resistant to all antibiotics. Although we were sure Dave was clear of these bugs, we did not have proof. So Dave spent the afternoon at the hotel pool while I attended the seminars.

Table 1



If you've ever been to a CF conference or event, you'll understand why such measures are necessary. There is a likelihood of cross-contamination between people with CF. Cystic fibrosis is characterized by the production of unusually thick, sticky mucus that typically blocks the lungs' airways. This consistent mucus production prevents clearance of bacteria, allowing them to colonize and multiply. As a result, chronic infection and inflammation occur, causing persistent coughing, sputum expectoration and wheezing.

Each conference attendee is given hand sanitizer, tissues and a plastic baggie in which to dispose of used items. People with CF are asked to refrain from touching others' utensils and serving items, and even hugging and shaking hands.

With all this in mind, I washed my hands one more time before I entered the conference room.

SCREENING FOR CF IN NEWBORNS

The California Department of Health Services' Genetic Disease Branch (GDB) is charged with developing a fair and efficient newborn screening program. California faces special challenges because of unidentified CF mutations among non-Caucasians, who make up more than 50 percent of the state's births. The GDB's Martin Kharrazi, PhD, who has a child with CF, spoke on this topic.

In 1982, 35 percent of live births in California were of Latino ethnicity, Kharrazi stated. By 2000, that number had risen to 53 percent. With the rise in Latino births has come an increase in CF cases.

In 1999, there were 59 new cases of CF in Caucasians (1/3,000), while there were 28 in Latinos (1/9,000). "We have more than just the white population to deal with," says Kharrazi.

A recent study by the GDB included 900 individuals with CF who were born after 1982 and are linked to California birth records. Table 1, opposite, shows the breakdown of mutation types by ethnicity. Some identified mutations only affected Caucasians, while others were solely found in Latinos or African-Americans. This, Kharrazi says, expresses just some of the intricacies of newborn screening.

BARRIERS TO ACCESS FOR CARE

Deborah J. Kaley, RN, MSN, nursing care manager of the Pediatric Pulmonology department of Children's Hospital of Los Angeles (CHLA) spoke extensively on issues that Latinos in the Los Angeles area encounter, including unreliable transportation, dependence on state aid, smoke and air pollution.

Apparently, this CF center is doing a fine job of reaching its Latino patients. A recent CHLA study of Latinos and Caucasians found that both groups correctly identified the disease process and treatments, and there was no difference in understanding therapy goals. However, Latinos performed more airway clearance treatments. There was no difference in enzyme or vitamin use, nor in the number of clinic visits or hospital days.

While the CHLA has many Spanish-speaking staff members, they feel that Latino families—and Pakistani and Filipino families—would benefit even more from being able to read publications in their own languages.

Kaley noted that the Latino diet may not necessarily be a poorer choice, since people with CF are encouraged to consume more calories than those who do not have CF. She also mentioned that Latinos with CF may appear to be on the lower end of the height and weight scale, but that may also be due to genetics. Kaley also suggested that in the past, Latinos and other ethnic groups may have been passed over for a CF diagnosis because CF was thought of as strictly a "white" disease.

CF AS A CHRONIC, NOT FATAL, DISEASE

Jane Braverman, PhD, states that the outlook for CF has improved dramatically. In 1980, the median life expectancy for patients with CF was 18 years. In 1990, that number jumped to 29. In 2000, it was 32.5. "Cystic fibrosis is now a well-understood, highly treatable and possibly curable disease," she said.

CF can be an isolating disease, especially for those who are not well enough to attend conferences such as this one. Michelle Compton created The Breathing Room, a place for people with CF to have candid, open communications.

Michelle was born in 1967 and diagnosed with CF at age 13. By her 20s, she experienced end-stage CF, including the use of 24-hour oxygen, a wheelchair and a bi-pap ventilator. In December 1998, Michelle underwent a successful double-lung transplant, and has enjoyed excellent health since. In addition to recently earning a bachelor's degree in history, Michelle art-directed Through the Looking Glass: Images of Adults with Cystic Fibrosis, which was on display at the CFRI conference.

Braverman noted that in Denmark, a country known for its rigorous antibiotic CF therapy, people with CF born after 1989 have an 80.4 percent chance of reaching age 45. The probability of surviving 40 years after a diagnosis of CF is 83.3 percent. Minnesota CF Center studies have shown that half of its patients are alive at age 46, and 95 percent of newly diagnosed patients can expect to reach age 21. Another impressive statistic: based on current models, 69 percent of women and 41 percent of men who survive until age 40 are expected to reach age 75.

Braverman reported the title of a recent paper: "Caring for the Geriatric CF Patient." She received a surprised laugh from the audience, which was comprised of hopeful parents, adults and children with CF, caregivers, researchers and health professionals. "Cystic fibrosis has evolved from a fatal disease to a chronic disease," she concluded. EP

Adapted Bikes Deliver New Independence

Learning to ride a bike is a rite of passage for many children. Its benefits include not only a sense of independence for children, but also better health from regular aerobic exercise, peer inclusion, the ability to participate in family activities, improved self-esteem and improved ability to make decisions. Parents of children with disabilities are often faced with a much larger challenge when trying to teach their children how to ride a bike.

Some parents try training wheels fitted onto conventional two-wheelers to accomplish this task. However, Richard E. Klein, PhD, Lauren J. Lieberman, PhD, Patrick DiRocco, PhD and Elaine McHugh, PhD have developed a new option. They believe that training wheels not only epitomize resignation to the "I can't" mentality, but that there are also shortcomings of training wheels in regards to effective learning of two-wheeled steering and balancing skills.

Instead, they recommend the use of a series of special rollers, an ergonomically correct frame design and gearing modifications. These new rollers contain adaptations necessary for children with special needs to succeed in learning to ride a two-wheeler. By switching to rollers of different crown characteristics in a progressive manner, the aspects of the bicycle/trainer can gradually resemble a typical two-wheeler.

In essence, these new bicycle/trainers act like slow motion machines that tailor the speed and motion, bringing them to a level that the child can manage. With slower forward speed and tipping action, the child is able to focus on task improvement, not bracing against falls. This allows the child to identify and internalize the appropriate responses or actions needed for steering and balancing a two-wheeler.

These researchers found that through use of this technique, some children with special needs have mastered a two-wheeler in as little as two hours, while others take longer. For example, of the approximately ten children with Down syndrome enrolled in their 2001 summer camps, all but one of the children became independent bicycle riders. Other advancement was noticed in children with autism, emotional and behavior disorders, Asperger's syndrome, mild vision impairment and developmental delays. The study also found that this new approach appears to be effective for many individuals with a variety of disabilities, as well as those without.

Top: Thirteen-year-old Kyle Leroux rides a purple bike that has Go-Cart tires.

Left: Seven-year-old Nicole Dahl rides the Bazooka bike with double rollers.

Clockwise from top left: Thirteen-year-old Chloë Dator, thirteen-year-old Kyle Leroux, nine-year-old Tommy Snook and eight-year-old Miranda Caristi .

Criteria for success

Successes were largely achieved in an environment that had an array of adapted bicycles, trained staff and a gymnasium or similar space where the bikes could be used on a clear, unobstructed floor. Peer interaction was also key to the process, as socialization and light competition encouraged the desire to learn. However, there are other factors that were necessary for successful learning:

- The child must have all limbs, be ambulatory and able to grip handlebars.
- The child must be able to pedal and propel a bicycle to a minimal extent.
- The child must have enough control of her/his movements to steer a bicycle.
- The child must have the strength and stamina needed to maintain continued pedaling and exertion that accompanies casual bicycle riding.
- The child must have the vision and/or spatial awareness needed to follow a designed course and avoid objects in their way.
- The child must willingly participate in training and respond to directions.
- The child must want to learn how to ride a two-wheeled bike.

Reasons for Lack of Success

According to the researchers, because of their methods no child has ever failed to achieve mastery of riding due to their inability to balance a bicycle. However, there are factors that could prevent a child from learning how to ride. They include:

- The child does not have the stamina to maintain pedaling because of a disability or chronic condition.
- The child cannot keep his/her feet on the pedals and therefore can't get going. This occurs when the child lacks motor control.
- The child lacks the ability to concentrate on the task of riding.
- The child's behavior precludes participation. For example, the child may display oppositional behavior and/or refuse to follow instructions, participate or wear a helmet.

Making these adapted bicycle/trainers and their associated programs commercially available is still being considered at this time. While a number of prototype bicycle/trainers have been constructed, this is not the same as production. The problem with mass production lies in the fact that the bicycle/trainers must be designed and built to withstand rigorous use. Efforts are underway to engineer the design of the adapted trainers for production, along

Getting Involved

Practitioners and parents in the disability community commonly ask, "How can I get my children involved?" The following are some suggestions that might help answer this question:

Any neighborhood group, community, agency or institution wishing to sponsor or host a camp or worksheet is encouraged to do so. A local camp must start with you.

Parents or professionals who would like to know more are encouraged to attend existing camps or host a workshop where the methodology can be explained in detail in their area.

Institutions offering camps typically offer open enrollment to any children who are referred.

Inquiries concerning hardware specifics and hardware availability should be directed to Dr. Richard Klein. Email: r-klein@uiuc.edu.

with appropriate tooling to facilitate the manufacture and marketing. EP

The information contained in this piece is based on the report "The Case of the Missing Bicyclist" authored by Richard Klein, PhD, Lauren J. Leiberman, PhD, Patrick DiRocco, PhD and Elaine McHugh, PhD.

Richard Klein, PhD is Director Emeritus of the Bicycle Research Institute for the Department of Mechanical and Industrial Engineering at the University of Illinois in Urbana-Champaign.

Lauren J. Lieberman, PhD is an Associate Professor in the Department of Physical Education at State University of New York (SUNY) at Brockport.

Patrick DiRocco, PhD is an Associate Professor of the Department of Exercise and Sport Science at the University of Wisconsin at LaCrosse.

Elaine McHugh, PhD is an Associate Professor in the Department of Kinesiology at Sonoma (California) State University.

An Instructor's Anecdote

Barbara Robinson, a graduate student in adapted physical activity at the State University of New York (SUNY) at Brockport, is in charge of the Brockport bicycling camp activities, under the direction of Dr. Lieberman. This is her story:

The children involved in the bicycle program at SUNY Brockport have exhibited great progression through the use of the "Adapted Trainer." The children gain confidence each time they ride on the bicycles, in large part because of the almost immediate experience of success. The children determine the level of the bike to be ridden. They inform their instructor whether the bike is challenging enough and when to attempt the next progression.

The stability factor of these bicycles is a safety net for the children, but the design also provides a realistic experience as far as tipping over is concerned. The gradual progression from two rollers to one on the back and a conventional tire on the front is a great idea. The design of the adapted trainers puts in place a base of support for the rider, encouraging the feeling of security and confidence while simultaneously providing a realistic challenge for the cyclist to maintain a stable position. It has been observed that if children experience setbacks, they will return to the previous (more stable) trainer, regain their confidence, then advance quite readily back up to the more challenging situation.

The success of our program can be seen by the laughter and smiles on the faces and the exuberance of the students riding freely through the gymnasium.

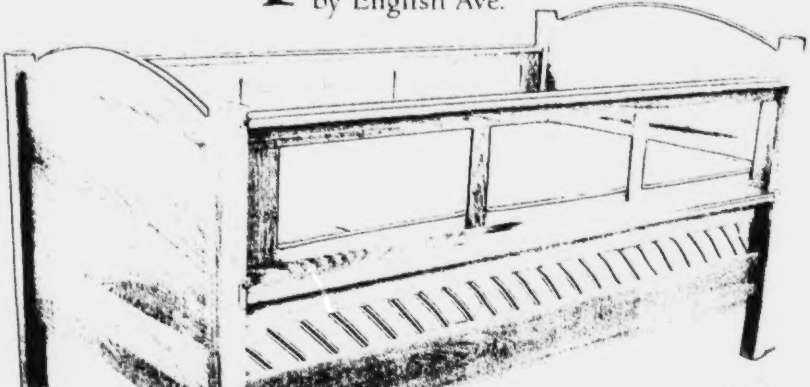
Once in awhile, something comes along that makes a lot of sense.

The
SleepSafe
Patented
by English Ave.



Ideal for sleeping safely at home!

Adaptive Side Safety Rails
SleepSafe's design is unique to the industry! Put rails up when you need to protect the patient. The clear window reduces claustrophobia. Take them down, or off, as you please.

Reduces Entrapment
Eliminates the gap between the headboard and mattress, as well as the gap between the side rails and mattress.

Built to Last
Rock solid construction keeps sleeping safe and eliminates the gap between headboard/footboard and mattress. SleepSafe's positive locking safety rails insures the patient's well-being. All hardware is adjustable in the field for easy maintenance.

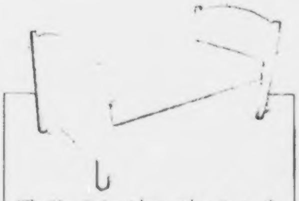
Hello!
Just wanted to touch base and say how much we love your SleepSafer™ bed! Samantha has been resting much better since she's been sleeping in her new bed. I have too!

Angie Leib, Waldorf, MD

New SleepSafe™ Adaptive Safety Bed Meets or Exceeds Safety Standards with Classic Style!

Designed with the advice from caretaking professionals, the SleepSafe™ is manufactured of solid red oak or clear maple and accommodates standard twin size box springs and mattresses.

- Adaptive full-length side safety rails combine the strength of solid wood with clear, acrylic panels and exceed bed safety standards.
- Designed to virtually eliminate the gaps between the headboard and the mattress, as well as the gap between the side rails and mattress.
- The headboard and footboard extend below the mattress, reducing the chance of entrapment.



The SleepSafe without side safety rails

The Magic of Snow

by Dorothy A. Levinson

When we were children we were told that there was magic in the very first snowfall of the year and that if we were to build a snowman with this first snow, he would come to life. This past March, I saw a different kind of magic in the snow.

My husband, Jerry, was diagnosed with multiple sclerosis in September 1969, and over the last 33 years I have watched the disease progress. At first, Jerry walked clumsily. Then, after ten years, he began using a cane; after twenty years he needed a wheelchair. Throughout this time, I've continually tried to find ways to make his life easier and as normal as possible.

About a year ago, two very good friends of ours, Pat and Pat De Pinto (simply known as "the Pats"), told us about the United States Adaptive Recreation Center (ARC) in Big Bear Lake, California. They explained that Big Bear Mountain Resort has skiing and snowboarding for people with disabilities.

I immediately picked up the phone to get as much information as possible, and to find out if I could get Jerry on the slopes. I managed to make a tentative appointment with the ARC for him to try skiing. I had never been skiing myself, but had always wanted to try; here was the perfect opportunity for us to have a go at it together.

To the Slopes

We drove to Big Bear Lake and stayed in a condominium located about ten minutes from the mountain. The accommodations were not really handicap-accessible, but we managed. After getting up early and dressing in ski clothes to help us stay warm, we made our way to the slopes. As it turned out, all of the instructors were busy with a busload of children with special needs from a local school, so Jerry did not get to ski.

Right after lunch it began to snow very hard and we found ourselves in the middle of a full blizzard with whiteout conditions. You should have seen the faces of those children, many of whom had never seen snow before. Some of them had physical challenges, some had developmental disabilities, while others had no or only partial vision—but they were all undeterred. They were having a blast!

The children with visual impairments were on skis that were linked at the tips by connectors designed to control their speed. They had tethers attached to their waists so that the instructors, who skied behind the children holding the other ends of the tethers, could give instructions and guide them down the slopes. I saw one child—legs amputated below the knees—on a snowboard closely followed by an instructor. Other children were in special ski chairs accompanied by pairs of instructors. All of them were having the time of their lives. It was magic.

Jean-Claude Levinson

This year I was more determined than ever to get Jerry on the slopes. We called early and were able to get an appoint-

Jerry and his ski instructors guide him through his first lesson.

ment in the middle of March. With much excitement we packed our gear in the car and took off to the mountains with the Pats.

Right after lunch we took Jerry to the ARC at the base of the slopes. First we had to fill out some paperwork that asked about the nature of his disability, how it affected him physically, his height and weight, etc. Then we met with his two instructors, who assessed his needs and abilities and started pulling out the necessary equipment for him to use (the cost was included in the lesson fee).

Before we knew it, Jerry was on a lift going up to the top of the "bunny slope"—the part of the mountain with a gently declining topography for beginners, the timid, and the downright cowardly. Jerry definitely fell into that third category when he started. It was amazing to watch how easily the instructors got him on and off the lift. Once on the ground, Jerry's chair skis just glided down the little slope. One instructor stayed behind him holding the tether while the other was in front of him giving him instructions. Jerry learned how to change directions by leaning to the left or right with "outriggers," Canadian-style crutches with maneuverable skis at the ends that the ARC had supplied.

I couldn't believe what I was seeing: Jerry was skiing! And doing a great job, too. After three runs down the bunny slope, the instructors took him to the top of the beginner slope. It wasn't long, though, before he had conquered that and moved on to the intermediate slope—at 8,600 feet. I couldn't watch him there because I am just not up to that level of skiing yet. Jerry's last runs of the day were down one of the most difficult slopes. He even went off two jumps! Not

continued from page 69

of the Winter Olympics type, more like leaping off two ant hills—but "jumps" nonetheless.

I was at the base of the slope when I saw him coming down. He was tearing down the mountain with a huge smile on his face, and his beloved Boston College cap was turned around like a kid's. It was almost as much of a thrill for me to watch Jerry that day as it was for him to be skiing. The whole experience may have gone to his head, though—he's thinking of legally changing his name to Jean-Claude. Clearly, we need to temper his enthusiasm a bit. All the same, we can't wait for the first snow of next fall so we can hit the slopes again.

The ARC

The U.S. Adaptive Recreation Center helps to guide people with disabilities toward the creation and affirmation of rewarding lifestyles. It offers challenging and adventurous recreational programs with excellent instructors and wonderful personnel who are specifically trained to work with the special needs person.

The ARC offers both summer and winter programs. The winter program runs from December to April; the summer program covers July and August, when Big Bear Lake becomes a playground for water skiers, kayakers, sailors, fishermen and jet-skiers. EP

For more information about the ARC go to http://www.usarc.org, or visit http://www.dsusa.org

Dorothy A. Levinson is secretary-treasurer of Benefits Research & Communications, Inc., of San Diego. Her husband Jerry has had MS for more than 33 years.

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O. Zisook

Sheldon O. Zisook

Disability Awareness Night at Fenway Park

EP Magazine, in association with the Boston Red Sox, celebrated Disability Awareness Night at Fenway Park on August 20, 2002. The event, which was a huge success, honored Red Sox pitcher Tim Wakefield, Massachusetts State Senator Fred Barry and inventor Bob Hall, as well as the 54 million Americans with disabilities.

The ceremony was held prior to the Red Sox vs. Rangers game. Wakefield was honored for his work on behalf of children with disabilities at the Spacecoast Early Intervention Center in his hometown of Melbourne, FL. Bob Hall, inventor of the wheelchair used by people with disabilities who compete in the Boston Marathon, was also honored.

Also participating in the ceremony were EP Magazine and United Cerebal Palsy (UCP). EP Magazine was founded in Boston 32 years ago, and has been serving the special needs community ever since. It is a source of information and support for many parents, families and health care professionals. UCP is a 52-year-old organization that serves more than a million people with disabilities.

Award winner Bob Hall, the founder of the wheelchair division of the Boston Marathon.

Understanding Dysphagia:
A Parent's Guide

By Debbie Lord, MA, CCC, SLP/L & Lee Barks, RN, MN, ARNP

This is the first of a monthly series written for EP Magazine by members of the American Association on Mental Retardation (AAMR).

Most of us never consider that we might not be able to eat or drink safely; in fact, most people take swallowing for granted. Swallowing, however, is quite complicated. Normal swallowing of food and liquid requires great coordination of a large number of muscles in the mouth, throat, and esophagus (the tube that leads from the throat to the stomach).

It involves many different systems working together quickly, effortlessly, and repeatedly. Normal swallowing is a very quick process, taking less than two seconds to move from mouth through the throat and into the esophagus. We swallow more than 1,000 times in a day. Most of those 1,000 swallows are involuntary, so we never really think about them.

When an individual has a problem swallowing it's called dysphagia. Some of the factors that may have an impact on a swallowing problem are:

☐ Neurologic deficits
☐ GERD (gastroesophageal reflux disease) – backward flow of stomach acid up the esophagus from the stomach
☐ Environment—furniture, overstimulation, feeder, etc.
☐ Previously learned behaviors
☐ Physical disabilities

How we swallow

Swallowing is a combination of purposeful movements and reflexes that normally take no more than several seconds to complete. The entire process can be described in three stages:

☐ Stage one, oral. This is where the food enters the mouth, is chewed and is mixed with saliva. It is then moved backward toward the throat. At the point where the food enters the throat (pharynx) the swallow begins.
☐ Stage two, pharyngeal. This is where the swallow is actually initiated. The food enters the pharynx (throat) at those large arches (facial arches) in the back of your mouth.
☐ Stage three, esophageal. This is where the food enters the esophagus and moves into the stomach.

Types of swallowing problems

There are many different types of swallowing problems. They may exist alone or in combination with each other. It is important to remember that there are many different factors that can contribute to a swallowing problem, and that people often have more than one problem. It is also important to note that each person and problem is different and requires individualized assessment and treatment.

Some of the things that may contribute to a swallowing problem are:

☐ Difficulty closing lips
☐ Difficulty moving/controlling tongue
☐ Weak face muscles
☐ Reduced or absent sensation in mouth
☐ Reduced or absent swallow trigger
☐ Difficulty coordinating various muscles involved in swallowing

Common causes of swallowing problems

Swallowing problems may arise from many different medical conditions or events. Most result in damaged sensations or weakened or uncoordinated muscles involved in swallowing. The following are some things that may cause swallowing problems:

Damage to nervous system

☐ Disorders affecting muscle strength or coordination, such as cerebral palsy or stroke
☐ Progressive neurological disorders, like muscular dystrophy or Alzheimer's disease
☐ Tumors of the head and neck, including malignant tumors
☐ Medication side effects
☐ Medication interactions
☐ Physical positioning problems
☐ Structural abnormalities, such as esophageal atresia or hiatal hernia
☐ Physical environment, for example inappropriate furniture or an overstimulating area
☐ Diet or diet changes
☐ Behavior

Common signs of a swallowing problem

Some people display no outward signs of having a swallowing problem, although most people do give some indication that they are having difficulty swallowing. A list of characteristics to assist in identifying individuals at risk for having a swallowing/feeding problem is given in the box on page 76. Observation of any one or combination of the symptoms/behaviors below may indicate the need for a swallowing evaluation and appropriate medical referrals.

What do you do if you suspect someone has a swallowing problem?

Use the common signs and symptoms checklist. The more information you have, the better.

Talk with or see the child's primary care physician and discuss your suspicions. Provide information that you've gathered from using the checklist. Ask for a dysphagia work-up and a referral to an appropriate physician, if necessary.

Find a speech pathologist (SLP) who performs dysphagia evaluations and who specializes in working with individuals like your child. You may need to consult an occupational therapist (OT) about positioning issues (a seated upright position may not always be the best position for safe swallowing).

Obtain a swallowing evaluation to determine if there is a swallowing problem and if further evaluation is necessary.

Further evaluation may be necessary, which may include an evaluation by an OT, physical therapist (PT), nutritionist and/or behavior specialist, or an evaluation by an ENT (ear-nose-and-throat physician, an otorhinolaryngologist), GI (specialist in gastrointestinal conditions) or pulmonologist (a physician specializing in the lungs and breathing). A video fluoroscopic swallow study may be needed. The most frequently used test for children is a video fluoroscopy (VFSS), which is a modified barium swallow or MBS.

Video fluoroscopic swallow study, or modified barium swallow. A radiologist and a swallowing therapist, usually an SLP, perform this test. A fairly low dose x-ray is administered over a short period, and the study is in motion—an x-ray/video. A small amount of barium, which is opaque ("radiopaque") on the x-ray screen, is mixed with particular textures of food and fluids and presented to the child orally. The swallows are viewed from the front and side. Positioning (usually seated or lying on a side) for the test is important, as are the food/fluid texture and consistency and method of presentation. A familiar person like a parent should present the food/barium and provide support, if possible. It is important to note that anyone will swallow poorly under bad

Circle #39 or visit www.eparent.com/adinfo

CHECKLIST FOR IDENTIFYING SWALLOWING PROBLEMS:

- Frequent episodes of gagging, coughing or choking
- Coughing or choking during or after eating/drinking
- Difficulty managing saliva (drooling)
- "Gurgling" voice (wet voice) during or after eating/drinking
- Watery eyes during or after eating/drinking
- Frequent upper respiratory infections and/or pneumonia
- Swallowing food whole
- Frequent vomiting
- Regurgitation, hours after meals, particularly while reclining
- Eating rapidly or taking in large amounts at a time
- Extra effort or difficulty chewing or swallowing
- Stores food/drink in mouth
- Loss of food/drink from mouth
- Poor weight gain or unexplained weight loss
- Fatigue or shortness of breath while eating

DANGERS OF A SWALLOWING PROBLEM

If a swallowing problem goes untreated, a person may:

- Become dehydrated
- Lose weight or become malnourished
- Develop aspiration pneumonia
- Be inappropriately medicated
- Become less alert
- Choke
- Potentially die

To prevent any of the above from occurring, children with a suspected swallowing problem should receive careful evaluation followed by appropriate treatment, if necessary.

continued from page 75

conditions. In this diagnostic test, we are trying to determine if the child swallows dysfunctionally under the best conditions, then provide those needed supports on a daily basis.

Upper GI series. This test usually includes a barium swallow and also continues viewing down the esophagus, into the stomach. It is used to rule out abnormalities of the esophagus and upper stomach.

Endoscopy, usually esophago-gastroduodenoscopy (EGD). This is direct visualization of the inside of the esophagus, stomach and duodenum (first part of the small intestine) through a fiberoptic scope, to look for abnormalities like overgrowth of certain cells, pouches (diverticula), ulcers or erosion. Tissue may be biopsied in this procedure, which is most often used in adults.

Esophageal pH monitoring. When stomach acid flows back upward into the esophagus (gastro-esophageal reflux or GER), the pH of the esophagus becomes more acidic. This test may be used to distinguish between aspiration (flow of food or fluid into the upper airway and trachea) that occurs during the swallow (dysphagia), and aspiration that occurs during GER. In the test, a probe (long wire with an acid sensor on the end) is put into the esophagus for a length of time. If the sensor detects an acid pH, the test may be considered positive for reflux. It is not often used in young children because of the difficulty of maintaining the probe in place for a sufficient length of time or of pulling out the probe.

Gastric emptying test, or gastric emptying time (GET). This determines a representative time the stomach takes to empty under usual conditions. It can be important, because delayed stomach emptying may "set up" GER, often resulting in aspiration. This process mimics dysphagia in producing aspiration. When the stomach can be influenced to empty into the duodenum in a reasonable length of time, GER may be prevented.

Salivagram. This test "tags" saliva and "detects" its presence when it flows into the trachea and lungs. Aspiration of saliva can be responsible for lung inflammation (pneumonitis).

Important consideration for follow-up

Once an evaluation is complete and it's determined that a plan of support for dysphagia is needed, it must be developed with both health and lifestyle considerations in mind. It is important to integrate the desired clinical, medical and functional outcomes with the individual's personal outcomes and desires.

It is important to consider the following:

☐ How important to the child is drinking independently?

☐ Does the child have hobbies or

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

Toys to Enhance Development in Brain Injured Children
by Richard A. Neubauer, M.D., Medical Director

Hyperbaric oxygen is capable of arousing dormant, idling brain cells that have suffered some form of damage, which is characteristic of all CP and brain injured children. The extent of this damage may be seen by functional brain imaging, and the results of any type of therapy, especially hyperbaric oxygenation, may be gauged by improvement in blood flow and metabolism as shown on repeat scans.

As new cells develop in little ones, or as dormant idling cells begin to fire electrically in older children, they need a sense of direction. To provide this, we recommend PT, OT, speech therapy, and at times acupuncture and appropriate counseling.

However, the role of educational, age-appropriate toys must not be overlooked. Toys should be chosen that will encourage developmental progress in the child. Building blocks, shape sorters and color matching games are among the various playthings that promote important fine motor and sensory skills. As children get older, certainly computers play a major role. Stereo players with motivational music tapes such as those from the Monroe Institute in Virginia* will also enhance development. Thus, when the parents of children with special needs look for toys, they should look for educational playthings that can be motivational aids in learning; entertaining items that will also play a beneficial role in their child's development.

Gynecological and Reproductive Healthcare for Women with Special Needs

By Catharine A. Kopac, PhD, GNP

This is the third article I have authored for EP in 2002 on gynecological and reproductive care for teenage and adult women with special needs. In February and May I reported the findings of two research studies conducted over the past decade. This article will outline issues that parents, direct support professionals (DSPs), health care professionals and teenage and young-adult women themselves face as they access gynecological and reproductive health care. It also describes approaches that parents, DSPs and primary care providers who support teens and young women with developmental disabilities have found to be helpful.

A Matter of Attitude and Perception

Heightened advocacy for people with special needs has resulted in a greater awareness of their need for comprehensive, quality health care. Unfortunately, not all areas of health care have received equal attention, and gynecological and reproductive care still remains outside the awareness of most primary care providers. One reason for this is that many providers do not believe they have adequate training to serve young women with special needs, and thus feel ill-equipped to deal with emotional and behavioral issues that may arise.

Another reason that teens with special needs do not receive care is that their parents and DSPs do not believe that these young women are sexually active and that, therefore, gynecological check-ups are unnecessary. While this point of view is common, it is often inaccurate. Many teens and young women are indeed sexually active and may not wish to disclose this to their parents. Even when not sexually active they still need to be tested for cervical, ovarian, and uterine cancer, especially as they get older. While sonograms can test for some types of cancer, a PAP smear is essential for the detection of cervical cancer. If women learn about their bodies from an early age, and meet regularly with a primary care provider who provides gynecological care, they will be much more likely to participate in and accept the regular care that is recommended.

An important consideration is the high rate of sexual abuse of young women with developmental disabilities. Primary care providers are in a strategic position to screen for and identify abuse of these vulnerable young women. If teens are seen early for gynecological care, particularly by a provider who is sensitive to abuse issues, they will be better equipped to avoid sexual abuse and to report it.

Anticipating Special Needs & Finding a Provider

For parents, DSPs, primary care providers and the young women themselves, the major barrier to gynecological care is often the young person's fear of the office visit or the exam. This fear, when perceived by the parents, DSPs and providers, is often a key factor contributing to the reluctance with which everyone approaches the needed gynecological care. Parents and DSPs don't want to cause unnecessary anxiety—which can often lead to acting-out behaviors—and some providers will try to avoid difficult persons. There are a number of things that can be done by both the parents/DSPs and the primary care providers to decrease fear and facilitate the office visit.

Research Tips For Caregivers

- Network with other parents/DSPs—find a provider who is known to offer care to young women with special needs, even if the provider is geographically outside your local community.
- Visit the office where the visit is to take place and determine if your teen's special needs can be met. If she has limited mobility and requires a lift onto an exam table, is there someone in the office who can provide assistance? Is the office wheelchair-accessible? Determine who will actually perform the exam. Meet that person and tell him/her about your teen's special needs. If sedation has been used for procedures in the past, it is helpful to let the provider know.
- If you do not believe that your teen is capable of informed assent (passive acceptance of a clinical action or participation), the provider should know this and understand how you have arranged health care in light of this issue.
- If your daughter is 18 years of age or older, informed consent is desirable for medical decision making. Remember that adults are usually afforded the opportunity

to give informed consent for clinical interventions. Unless the young woman is well prepared in advance she may not consent to an exam that she fears.

Routine pelvic examinations, PAP smears and mammography do not require written informed consent. However, primary care providers will rarely perform examinations or procedures on people who do not have some level of understanding about what is being done.

- Whenever possible, the provider should know if the young woman is sexually active. A provider who knows about sexual partners and can incorporate a discussion about them into the visit is better able to individualize examinations and health education of the young woman.
- Young married women with special needs should make every effort to have their husbands accompany them on the visit. The presence of a spouse may be reassuring during a pre-examination discussion and, for some women, during the exams themselves. Both husband and wife can benefit from the health education opportunity.
- Determine whether the provider will reserve the additional time that may be required for the exam.
- If you have a teen with behavior problems, scheduling the appointment so that it is the last in the day may be a way to avoid difficult situations in waiting areas.
- If a visit to the home of the teen would be best to perform examinations, inquire about this possibility.
- Remember to verify that the provider will accept the payment plan that is available to your teen (Medicaid, HMO, PPO). Some providers do not accept Medicaid persons and/or a provider may not be part of her plan coverage.

Hints For Primary Care Providers

Office staff require education about caring for persons with special needs.The following are some ideas that can aid in educating staff members about what is required of them during an appointment with a person with special needs.

- It may be necessary to have special continuing-education offerings for both professionals and support staff to discuss specific disabilities and their management.

Anderson School

Building A Tradition of Service for Over 78 Years

Anderson School provides the highest quality programs possible for children (ages 5-21) and adults with autism and other developmental disabilities. Anderson School is an educational residential community committed to an ongoing and fully integrated support network for their families and guardians. As an organization, Anderson School constantly strives to provide an enriched and positive climate filled with educational, cultural and recreational activities designed to foster continuous growth, independence and social interaction.

Located near historic Hyde Park (approximately 95 miles from midtown Manhattan) on a scenic 100 acre wooded estate overlooking the Hudson River, Anderson School serves all of New York State and welcomes out of state applications.

1183

continued from page 79

- Special procedures may need to be developed for planning and executing visits of teens and young women with special needs.
- Carefully selected educational materials should be available for the parent/DSP and the young woman. It would be wise to provide some of this material well in advance of the visit.
- The office environment should be assessed to determine if it can accommodate young women with special needs.
- The office should be physically accessible to wheelchairs, walkers and other mobility devices.
- Wait times should be limited; scheduling should be done at the beginning or the end of the day to limit wait times
- The space used for the exam should be selected with care. Some teens and young adults make noises that can be alarming to other people. Thus, it would be better to use an examination room at the end of the hall or somewhat separated from others.

> **A health care professional can perform no greater empowering act than to teach someone to care for herself, and so it is with the teenager with special needs.**

- The office may need to be customized to allow for exams on the floor (an exercise mat can be covered with disposable paper) or a sofa, as some people with disabilities simply cannot use stirrups.

The Gynecological Office Visit

The first office visit for a gynecological examination can be a stressful experience for all concerned. However, there are certain approaches that will facilitate the provision of care. A good gynecological visit for a teenager or young adult woman would include a gynecological history (onset of menses, menstrual problems, frequency of menses, etc.), pelvic examination and PAP smear, clinical breast examination and education tailored to the needs, concerns and abilities of the teen or young woman.

Ideas for Parents/DSPs

- Prepare the teen in advance for the visit. No one likes to be surprised with procedures as intimate as those required in breast and pelvic examinations. Pictures that show what will be done are often helpful. The young woman needs to be reassured that she will not be left alone with a stranger. If your teen says that she would like to see the provider alone, her choice should be respected.
- Schedule the visit for a day when the young woman is not likely to be menstruating.
- Before the appointment, anticipate some of the questions that the provider may ask and help your teen think about them; eg, when did she last menstruate?
- Explain at home the need to get undressed and help your teen to select clothing that is easy to remove or accessible for the provider.
- If appropriate, say that you would be willing to have the provider examine your breasts first so that she can watch. This should be arranged with the provider in advance. Some providers will demonstrate aspects of the exams on themselves.

Recommendations for Primary Care Providers

- The person must be greeted as a person and spoken to directly even if the parent or DSP responds to questions. Try to elicit some responses from the young person herself.
- Spend time getting to know the teen and determine what she can understand.
- It may be necessary to discuss the examination on the first visit and schedule a second visit to the exam.
- Determine if the teen wants a family member/DSP in the room with her while the exams are being done.
- Flexibility is key. If the person cannot or will not get on a table, a predetermined alternative should be available.
- Alternative positions may need to be used when doing the pelvic examination (Planned Parenthood offers "Table Manners," a helpful guide).
- As the exam is being done, continue to talk to the teen and reassure her.
- The provider should be prepared to show where s/he is going to touch the young woman.
- If all else fails and the young woman refuses the exam or refuses to cooperate, a sedative or even general anesthesia may be necessary.
- Pregnancy status must be checked.
- Testing for STDs is important and should be done every six months, depending upon sexual activity. Chlamydia is a big problem within this population, and its presence will confirm that the young woman is sexually active.
- Sonograms can help to determine certain diagnoses and may eliminate the need for more invasive procedures.
- It is not uncommon for persons with special needs to be incontinent during a pelvic examination; the provider should reassure the young woman (particularly if this is her first exam) and her parent/DSP that this sometimes happens and isn't an issue.

- Screen for abuse. Signs of abuse include bruising, struggling or "fighting" the exam and a stretched vagina.

Consumer Education

A health care professional can perform no greater empowering act than to teach someone to care for herself, and so it is with the teenager with special needs. All too often, though, in an attempt to hurry through a clinical encounter, teaching is overlooked and information is given to the parent or DSP who appears to understand more readily.

Whenever possible, the young woman should be taught how to care for herself, thus reinforcing the responsibility of tending one's body in an appropriate way. Education about health is a cooperative endeavor

continued on page 82

Consumer Education Materials

There are many sources of education literature available for both the parent/DSP and the primary care provider. It is imperative that materials be selected carefully and matched to the individual. Many of these items are available from organizations that can be accessed on the World Wide Web. The abbreviated list below is a place to start:

continued from page 79

between the parent/DSP and the primary care provider, who can each approach the teenage woman in an individualized way that recognizes her ability to understand and participate.

Special education materials have been developed for this population. Their education should include:

- Hygiene
- Safe sex practices and birth control
- How to maintain a calendar and keep records of the menstrual cycle
- What clinical breast examinations are and how/why they should be performed

I am reminded of a conversation that I had with an adult woman who had cerebral palsy. Although she had loving parents, her gynecological care was virtually ignored. She was in her twenties when she had her first pelvic examination and it was a painful, embarrassing experience. She did not seek care again until, in her thirties, she had a problem that needed treatment. This led to another negative experience and then, finally, a friend who also had cerebral palsy told her of a gynecologist who cared for a large number of women with special needs.

She now flies nearly 2000 miles per year to get her routine pelvic examination and PAP smear. She believes that her efforts to see this special physician are worth it because she receives good care and she trusts the physician. She is fortunate to have both the "great" physician and the resources to visit him each year. One wonders how many teens and women go without care because they cannot find a provider and/or they lack resources.

In the May 2002 EP article I discussed barriers to care experienced by adolescents and women with special needs. The two barriers most frequently cited in a study of 727 practicing nurses were:

1) a lack of empathy and/or knowledge on the part of the healthcare providers, and

2) difficulty finding providers who were willing to care for women with developmental disabilities.

Given these two issues, it is imperative for parents/DSPs and providers alike to seek gynecological and reproductive health care for their teenage daughters earlier rather than later. If the gynecological examination and visit are seen as routine, as she matures the young woman is much more likely to view it as a part of responsible preventive health care. **EP**

Catharine A. Kopac is currently a primary care fellow in the Center for Clinical Bioethics at the Georgetown University Medical Center in Washington, DC. At present she has a research and practice interest in three vulnerable populations: persons with Alzheimer's disease, older adults requiring long-term care and women with developmental disabilities.

This material was excerpted from Kopac, C and Fritz, J (2002). The Availability and Accessibility of Gynecological Services for Women with Developmental Disabilities: A Nursing Perspective, an article submitted to the Journal of Women's Health and Gender Based Medicine.

The author would like to acknowledge two people who were invaluable in the development of this article. Vera Thomas, a nurse-midwife with many years of experience in serving young women with special needs, for very unselfishly giving of her time in consultation, and Joni Fritz, my research collaborator, who has 30 years of experience in the field of developmental disabilities, for providing expert advice and editorial support.

IN MEMORIAM

Diane J. Lipton (1945-2002)— Disability Rights Leader

Diane Julia Lipton, the Director, of the Children with Disabilities Advocacy program, at the Disability Rights Education and Defense Fund (DREDF), died at the age of 57. She struggled with cancer for two years. Lipton found her calling when her daughter, who has Cerebral Palsy, was segregated and deprived of her educational rights as a child in the Richmond, California School System. Diane began advocating for her own child and then became a nationally recognized spokesperson for the rights of children with disabilities to receive integrated, appropriate, dignified educational services. With other parents, Diane was able to orchestrate the closing of all disability-segregated schools in Richmond.

She received a number of awards and honors including two American Jurisprudence Awards, and the Distinguished Parent Award, from the Association for Severely Handicapped (TASH). Honors and awards also came from the Developmental Disabilities Council, and the National Center in Educational Restructuring and Inclusion.

The family has requested that contributions be made either to the Disability Rights Education and Defense Fund in Berkeley, California, or to East Bay Innovations in Oakland, California.

Dr. Henry Enns Dies at 59

It is with deep regret that the Board of Directors and the staff of the Canadian Centre on Disability Studies announce the sudden death of Dr. Henry Enns, Executive Director of the Centre, on August 12, 2002. Dr. Enns was a pioneer, an activist and a visionary for people with disabilities. He was a leader at the local, national and international level all his working life.

Dr. Henry Enns most recent work, the Canadian Centre on Disability Studies (CCDS) embodied his vision of an integrated approach to understanding disability. The Executive Committee of CCDS has appointed Dr. Deborah Steinstra as Acting Executive Director and remains committed to Henry's work and the Committees' collective vision. The work of the CCDS continues as an important legacy to the memory of Dr. Henry Enns.

NBC Soap "Passions" Loses Star

Josh Ryan Evans, "Timmy" of NBC's "Passions," passed away on August 5, 2002 at 20, due to complications stemming from a long-time congenital heart condition. Josh was diagnosed at a young age with Achondroplasia, a rare disease and form of congenital dwarfism that prevented his body from maturing and restricted cartilage growth and physical development.

Josh was 3'2" tall and famous for using his size as an asset as his features allowed him to play both child and adult roles believably. He was a star on "Passions" since its debut in 1999, has appeared on "7th Heaven" and "Ally McBeal" starred in "Dr. Seuss' How the Grinch Stole Christmas" (2000) and has also done voice-overs on the Nickelodeon series "Rugrats" and "Hey Arnold."

At his family's request, donations may be sent in Josh's name to the Make-a-Wish Foundation in lieu of flowers. Donations may be made via phone at 1-800-880-1382 or online at www.makeawish.org.

New Aviation Hotline from Department of Transportation

On August 5, 2002, the Department of Transportation's aviation consumer disability toll-free hotline became operational. The toll-free number for the aviation consumer disability hotline is (866) 266-1368 (voice) or (866) 754-4368 (TTY)

New Web Site for Direct Support Professionals

The National Alliance for Direct Support Professionals has posted their new web-site at www.nadsp.org. The group is composed of individuals and organizations, such as ARC, The United Cerebral Palsy Association and The American Association of Mental Retardation. It is intended to help correlate and strengthen the efforts of the direct support workforce. These aids encourage and help children follow their goals and dreams, whether it is rehabilitation, education, or a career.

10 Lucky Kids Win Scholarships

Frosted Flake mascot Tony the Tiger turned 50 years old on August 16, 2002 and Kellogg CEO Carlos M. Gutierrez awarded all ten finalists in the company's contest for "courageous and inspirational" children a $10,000 scholarship. The winners, which included a blind child who teaches Braille and a ten-year-old living with cancer and hemophilia also met Rosie O'Donnell and Nick Carter during the celebration.

organizational spotlight

The Tuberous Sclerosis Alliance

By Marybeth Leongini

MISSION STATEMENT

The Tuberous Sclerosis Alliance is dedicated to finding a cure for tuberous sclerosis while improving the lives of those affected.

HISTORY

Founded in 1974, the Tuberous Sclerosis Alliance (TS Alliance) was established by four mothers who sought to provide fellowship, generate awareness and provide hope to those that share the common bond of tuberous sclerosis complex (TSC). TSC is a genetic disorder characterized by seizures and tumor growth in vital organs.

In addition to serving as an advocate and promoting research on TSC, the TS Alliance serves as a clearinghouse for families and physicians seeking current and comprehensive information on TSC.

WHAT IS TUBEROUS SCLEROSIS COMPLEX?

First described in the 1880s, tuberous sclerosis complex (TSC), also known as Bourneville's disease, is a genetic disorder commonly characterized by seizures and tumor growth in vital organs such as the brain, heart, kidneys, lungs and skin. The name "tuberous sclerosis" comes from the characteristic tuber or root-like growths in the brain, which calcify with age and become hard or sclerotic. In most individuals, the disease affects only some of the vital organs. The disorder affects some people severely, while others are so mildly affected that it often goes misdiagnosed or undiagnosed. Many people with TSC experience developmental delays, mental retardation or autism. Many TSC manifestations also develop later in life. Some individuals who are mildly affected by TSC lead active and productive lives, but it is important to realize that a diagnosis of TSC can mean life-long complications and individuals should receive continuous follow-up care.

Because of advances in testing methods, the number of diagnosed individuals has risen dramatically in recent years as people with less-severe manifestations of TSC are identified. Population-based studies indicate that TSC has an incidence of one in 6,000 live births. It is estimated that approximately 50,000 Americans and 1 million individuals worldwide have TSC. There are also many undiagnosed cases of the disorder as a result of the obscurity of the disease and the mild symptoms some people have. TSC is as common as Lou Gehrig's disease (ALS), but still virtually unknown by the general population.

A LEGACY OF SERVICE INFORMATION

Because TSC is often difficult to diagnose and proper management of TSC is essential to optimum health, the TS Alliance continues to focus on educating medical professionals through medical conferences, outreach and awareness efforts and alliances with a number of patient advocacy programs.

By producing informative fact sheets, brochures, and other resources, the TS Alliance strives to educate healthcare providers on identification, diagnosis and treatment protocols. *Perspective*, the organization's quarterly newsletter, offers families current news about the Alliance along with research updates, government relations actions and special events. A constantly evolving Web site (http://www.tsalliance.org) serves as the primary source of information to a worldwide community of doctors and families seeking up-to-date information about TSC, while also serving as a networking tool for families to share support and information through various list-serves.

One of the most recent initiatives, The Life Stages Guide, was created to provide detailed information to assist individuals with disabilities, their family members and others in coping with the day-to-day challenges of life with a disability. Raising a child with special needs is often likened to a journey or voyage. Using this analogy, The Life Stages Guide addresses the four stages of life:

- **Starting the Voyage**—The Early Years (ages 0-5)
- **Staying the Course**—The School Years (ages 6-13)
- **All Hands on Deck**—The Teen & Young Adult Years (ages 14-21)
- **Setting Sail**—The Adult Years (ages 21 and above)

Locating information on programs and services for individuals with a disability is a daunting task. The goal of The Life Stages Guide program is to provide a comprehensive source for educational, social, financial and vocational information. Setting Sail - The Adult Years section of the guide is now available and work is currently underway on All Hands on Deck - The Teen and Young Adult Years.

SUPPORT

An extensive network of dedicated volunteers across the country donates its time, talent and energy to support the Volunteer Outreach Program. Our Volunteer Outreach Program includes the TS Alliance Support Network, Matching Program, National Outreach and Awareness Campaign, community fund-raising events and Community Alliances. This program enables volunteers to create awareness of TSC in their communities, to establish peer connections and to participate in fund-raising events and campaigns.

The TS Alliance Support Network is an organized partnership of individuals whose lives have been affected by TSC. This national network of volunteers provides individual, family and caregiver support and organizes community gatherings and support groups on the local level. A recently revised initiative, the TS Alliance Matching Program is designed to match individuals and/or families throughout the country who are experiencing similar challenges. The matching program provides people with the peer support that may not be available in their communities.

Community Alliances are local volunteer committees that empower and engage volunteers in local support for individuals and families and in community fund raising. They also promote outreach and awareness campaigns to raise the visibility of the disorder to the medical community, community agencies and school systems.

REACHING OUT THROUGH THE HALLS OF CONGRESS

In the year 2000, the Tuberous Sclerosis Alliance launched an aggressive government relations program.

Last year the first fruits of this labor were seen with the establishment of The Tuberous Sclerosis Research Program in the Congressionally Directed Medical Research Program (CDMRP) in the Department of Defense. The Tuberous

Specially trained dentists and custom facilities are desperately needed in New Jersey to treat individuals with physical disabilities, such as cerebral palsy, muscular dystrophy, spina bifida, and Lesch-Nyhan disease.

The Delta Dental Plan of New Jersey Foundation is partnering with Matheny School and Hospital to create a new, state-of-the-art dental facility to improve access to dental care. This initiative is part of Delta Dental's mission to promote and assist educational projects devoted to the enhancement of dental health and research programs designed to increase public awareness of the general benefits of good health, and to improve dental health through the science of dentistry. For more information about the Matheny School and Hospital dental facility, call (908) 234-0011, ext. 231.

Sclerosis Complex Research Program was added to the CDMRP in 2002 at the funding level of $1 million.

RECOGNIZING RESEARCH IS OUR FUTURE

Research into the genetics of TSC may shed additional light on the causes of other conditions. The Center Without Walls (CWW) was created to enable researchers to share information and resources, thus expediting research results and their translation to improved clinical care of individuals with TSC.

HOW DOES ONE DEVELOP TSC?

TSC is transmitted either through genetic inheritance or as a spontaneous genetic mutation. Children have a 50 percent chance of inheriting it if one of their parents has the condition. Right now, only one-third of TSC cases are known to be inherited, while the other two-thirds are believed to be a result of spontaneous mutation. What causes these mutations is still a mystery.

WILL A CHILD BE MILDLY AFFECTED IF THE PARENT IS?

People with mild cases of TSC can have a child who is more severely affected. In fact, some people are so mildly affected that they may go undiagnosed until their more severely affected child receives a diagnosis of TSC.

WHAT CAUSES TSC?

Two genes have been identified as causing TSC, but only one of the genes needs to be affected for TSC to be present. The TSC1 gene is located on chromosome 9, the same chromosome that carries the gene that determines blood type. The TSC2 gene is located on chromosome 16. TSC occurs when an individual has a mutation in either the TSC1 or the TSC2 genes. The mutation can be inherited from one parent or can be a new mutation (sporadic event) that developed within the person. Recent studies have shown that in familial cases of TSC (when there are two or more people with TSC in the family), about 50 percent of the families have a mutation in TSC1, and the other half contain a mutation in TSC2. Research has also shown that in sporadic cases of TSC (where there is no prior family history of TSC), more of the individuals have a mutation in the TSC2 gene than in the TSC1 gene.

HOW IS TSC DIAGNOSED?

Until recently, diagnosis of TSC was based on clinical findings. Some of the tests used to assist in making the diagnosis are a brain MRI or CT scan, renal ultrasound, echocardiogram, EKG, eye exam and a Wood's Lamp evaluation of the skin. In September of 2002, the TS Alliance announced the transfer of a diagnostic genetic test for TSC from a TS Alliance-funded research environment to a fee-for-service clinical laboratory, Athena Diagnostics. As a result of this transition, DNA testing for TSC will be more widely available to individuals with TSC, their families and also to their physicians.

WHAT IS THE NORMAL LIFE EXPECTANCY OF AN INDIVIDUAL WITH TSC?

Most people with TSC will live a normal lifespan. There can be complications in some organs such as the kidneys and brain that can lead to severe difficulties and even death if left untreated. To reduce these dangers, individuals with TSC should be monitored by their physicians throughout their lives for potential complications .

PROFILES OF COURAGE

Anna Enstrom is a 27-year-old with tuberous sclerosis complex. Diagnosed in 1978, Anna has severe cognitive and physical disabilities. She has continued to surpass the life expectations forecast by medical doctors and other experts, and she is an inspiration of strength to many people.

Sophia Mayrsohn is almost 5 years old. Her parents learned of her diagnosis when she was just 10 weeks old. Sophia has many hamartomas (tubers) in her brain and has intractable epilepsy, despite the fact that she has undergone epilepsy surgery twice. Through all of the pain and suffering Sophia's family has become much stronger. In the words of her mother Kathy, "Living with TSC has made me a better person. I don't take things for granted anymore. My daughter Sophia is my biggest hero. She has suffered so much, yet continues through all of this with a huge smile on her face."

Cade Scott celebrated his 11th birthday on August 1, 2002. He was diagnosed with TSC when he was just 7-and-a-half months old and continues to struggle with the many issues that this condition brings. His mother Nancy clearly remembers the very moment—the where, the when and the how—of hearing the words "tuberous sclerosis" for the first time. "...the fear of the unknown that overtook us that day and the uncontrollable spin our lives took in what had seemed a controlled world only moments before. Within a week we became connected with the TS Alliance and felt fortunate to have found them so quickly. Our relationship with the organization began to grow; the more we became involved the more benefits we experienced. As we gained knowledge of TSC and our support network of friends grew we felt in control of our lives again," says Nancy.

Robbie Seymour is a 5-year-old with TSC. When Robbie was younger, the prognosis for his ever being able to talk in full sentences was poor. Today, thanks to his self-motivation, his devoted and loving parents, and some very caring speech therapists, the hope that he would one day speak has become a reality. Robbie continually exhibits strength, intelligence and courage that all who know him are sure will continue with Robbie on his journey through life.

SINCE THERE IS NO CURE, WHAT CAN BE DONE?

Early intervention is helping to diminish developmental delays, and advances in research bring new and improved therapeutic options. Surgery to remove tumors now helps to preserve the function of affected organs. With improved technology, we can start to pinpoint the exact portions of the brain undergoing seizures, and create new therapies to help control seizures. Each day brings us closer to finding improved treatments. People with TSC can stay informed about the advances that are made by becoming a Tuberous Sclerosis Alliance member and receiving information and updates. Call toll-free at (800) 225-6872; send an e-mail to info@tsalliance.org; or send a letter to 801 Roeder Road, Suite 750, Silver Spring, MD 20910 for more information or to become a member. **EP**

Marybeth Leongini joined the Tuberous Sclerosis Alliance as director of communications in May of 2002. Her responsibilities include media relations, publication management and web development. She received her bachelor's degree from Belmont Abbey College in North Carolina and completed her graduate studies at the University of South Carolina's School of Journalism and Mass Communications.

AUTISM RISING:

Delivering Services without Draining Parents and School Systems

The increase in children with autism or autistic-like disorders—no matter whose statistics or definitions you use—appears real and here to stay. At the same time, parents of children with autism find themselves at odds with their child's school as to the best way of treating and helping them. For their sake, we hope that parents, educators, researchers, and government officials can be allies and not adversaries.

Autism is a neurodevelopmental disorder defined by developmental delays and maladaptive behaviors. The 2000 Diagnostic and Statistical Manual of the American Psychiatric Association characterizes autism by marked impairments in social interaction, delays and/or disorders in communication, and restrictive or repetitive patterns of interests or behaviors (e.g., stereotypical behaviors). Autism is also a disability category covered by the Individuals with Disabilities Education Act (IDEA). The early onset, severe behavioral challenges, and poor long-term prognosis combine to make this one of the most stressful disorders for families.

In recent years there has been a striking increase in the number of children diagnosed with autism. Using the Department of Developmental Services database in California, for example, Lisa Croen and her colleagues just reported that prevalence rates from 1987 to 1994 increased from 5.8 to 14.9 per 10,000.

Peter Sturmey of Queens College, and Vernon James of the Texas Center for Autism Research and Treatment, also reported high prevalence rates (16 per 10,000) using data from the Texas education system in the year 2000. However, as in other reports, the number was higher for younger children (grades 1 through 3) at 22 per 10,000. In his 2002 presentation at the Gatlinburg Conference for Research on Mental Retardation and Developmental Disabilities, Paul Shattuck of the University of Wisconsin-Madison provided detailed statistics on national trends in the prevalence of autism in public schools. He reported that from 1994 to 2000, the average annual increase was 21%!

Bigger Pool or Better Diagnosis?

Certainly, the numbers cited above are compelling, and the media has made headlines of them. One reason for "autism rising", is that the diagnostic criteria and definitions have changed. Many children who do not manifest the "full syndrome" of autism still bear the label, because they fall along an "autism spectrum."

Related disorders, hardly diagnosed before the last 15 years, are Asperger's disorder and Pervasive Developmental Disorder. In fact, the prevalence figures I cited would be even higher if the full range or spectrum of autism-related conditions were included. This expansion of what we consider "autism" results in more frequent use of the label, more research focus on autism spectrum disorders, and a greater likelihood that the disorder will be identified by parents, physicians, psychologists and school professionals. Whether there is also increased environmental or genetic risk for autism today is unclear, but the demand for services, particularly early intervention, is real indeed.

Critical Diagnostic and Treatment Timing

Autism is usually diagnosed by the time an affected child is 2 or 3 years old and there is convincing evidence that the next two or three years provide a window wherein intervention must be carried out to be maximally successful.

In a recent essay on autism in the journal Science (2001), Erik Stokstad stated that "the treatment with the most scientific support is behavioral training." This consists of intensive therapy, often up to 40 hours a week, delivered in the child's home setting. It likely results in children who "follow instructions better, learn how to imitate, and have enriched vocabularies" (p. 37).

Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, where she has been a researcher for 20 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of mental retardation, dual diagnosis and the transition to adulthood. Dr. Blacher has developed **Research Reflections** as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to **Research Reflections** and any suggestions you might have. Send e-mail to: jan.blacher@ucr.edu.

The empirical support for this model stems from a seminal 1987 research paper by Ivar Lovaas, of UCLA. Children who receive this intensive intervention often transition into preschools or kindergartens with typical peers who provide more language and social exchanges opportunities than would be available in a classroom containing only children with autism or related disorders.The "rub" in this is that the treatment costs thousand of dollars each month ($40,000 a year and up). Few families are able to pay this amount and few school systems are willing.

It is clear that neither parents nor school officials will be able to go it alone much longer if the growing numbers of children with autism diagnoses are to be served.

School administrators balk at the costs, focusing on the annual budget over the long-term economic gains if even a modest percentage of children with autism become independent of the service delivery system and gainfully employed adults. School districts characteristically offer scientifically indefensible strategies in a self-contained classroom for children with autism and other, unrelated disorders. To further frustrate already stressed and scared parents, teachers and their aides are often woefully ignorant of, and/or inexperienced in the use of, behavior analytic techniques.

What has ensued is a flurry of administrative hearings, sometimes advanced to court, whereby parents demand a home program for their child, perhaps supplemented by placement in a class containing typical peers. (To date, no one has tallied the millions of dollars in legal

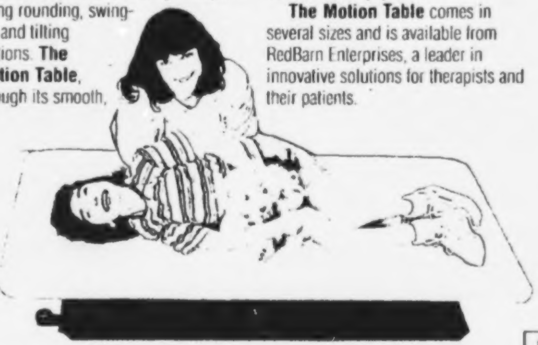
Get More Out of Vestibular Stimulation with The Motion Table

The Motion Table enables therapists to deliver the value of vestibular motion to their patients without the need for constant hands-on intervention.

Most stimulation equipment available today reduces the therapeutic effect of *horizontal motion* by incorporating rounding, swinging and tilting motions. **The Motion Table**, through its smooth, "vibra glide" movement provides a steady, uniform stimulation that can help "level out" extremes in patients' behavior.

And, since **The Motion Table** is motorized, patients can be stimulated for longer periods than is possible with manual equipment.

The Motion Table comes in several sizes and is available from RedBarn Enterprises, a leader in innovative solutions for therapists and their patients.



The Motion Table reduces...
- *Hypersensitivity*
- *Self-abuse*
- *Abnormal Muscle Tone*
- *Constipation*
- *Pulmonary Congestion*

The Motion Table increases...
- *Concentration*
- *Attentiveness*
- *Calmness*
- *Body Awareness*
- *Postural Control and Balance*

RedBarn ENTERPRISES

Try The Motion Table AT NO RISK for 30 days.
Try it for a month. If you're not completely satisfied, just send it back for a complete refund.

For a copy of a just-released Technical Evaluation of The Motion Table or additional product information, call us at 1-800-577-1317, or visit us on the Worldwide Web at www.redbarn-enter.com.

For more information on **RedBarn**, or to place an order, call **1-800-577-1317**, email us at: info@red-enter.com, or visit our web site at **www.redbarn-enter.com**

continued from page 95

costs spent by school districts in fighting parents—monies that could have funded programs for many children). There are dilemmas here to be sure. Parents cannot be faulted for desiring an empirically valid treatment for their child—one that must be delivered early on during the "window of opportunity" for learning. Yet school resistance, requiring family legal counsel, limits eventual access to more affluent families. From the school district's perspective, there is a crisis in both available funding and in teacher preparation.

There is a need to offset the long-term costs to the nation of providing appropriate educational treatment for children with autism. I see four specific actions that can be taken that may alleviate some of the financial and emotional drain that serving young children with autism is causing:

- ***More support for research on treatment effectiveness.*** While research supports the effectiveness of applied behavior analysis, it is essential to "dismantle" effective treatment packages to see which components are essential to their success. We need to determine the ideal number of hours of discrete trial training and how this approach is best combined with other approaches (e.g. incidental teaching,

peer interactions). We need comparisons of service delivery settings (e.g. home vs. school). We need data on the long-term effects of interventions, on their impact on families, and on how they can be realistically incorporated into non-research settings. Such research requires a major commitment by governmental agencies, such as the $38.8 million autism clinic and research center that California is building at UC Davis.

- ***More targeted assistance for professional development.*** Special funding allocations, perhaps in the form of personnel preparation grants, need to be made to universities and colleges for the purpose of training teachers who will specialize in autism. An applied behavior analysis component is essential. School districts could also receive some financial incentive for sending teachers to such programs.

- ***School district willingness to to set up state-of-the-art programs to serve young children with autism:*** I have personally observed many programs that were described by school officials as model programs, but then fell far short in practice. Rarely are the teachers and assistants appropriately trained behaviorally, and rarely is the service delivered intensively, with data collected for the purpose of demonstrating any kind of long-term durable effect. With the increased autism census, it is now more possible, and more necessary, for school systems to establish "best practice" centers.

- ***Parents need to be partners in the autism intervention:*** Parents should have a key role in early intervention. Just as parents of a child with diabetes or PKU have to alter and monitor their child's diet, parents of a young child with autism need to carry some of the responsibility of learning behavioral techniques themselves, of home teaching, and of providing "real world" opportunities for the child to generalize skills and language learned in other settings. EP

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in Exceptional Parent.

How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly.

Be sure to tell them you saw their ad in Exceptional Parent!

Prenatal Screening vs Newborn Screening

By Frank Manginello, M.D.

Director of Neonatology and Medical Director, Center for Child Development, The Valley Hospital, Ridgewood, NJ

Q What is the difference between prenatal screening and newborn screening? How do I know when I need one, the other, or both? Why is screening so important?

A Both prenatal screening and newborn screening have a similar goal: to identify whether the baby has any health problems. Parents can certainly benefit from both prenatal and newborn screening, as each provides different types of information about a baby's health. The most significant difference between the two types of testing is actually a matter of timing. Prenatal testing is performed on the mother during pregnancy; newborn screening is performed after the baby is born.

PRENATAL TESTS

Prenatal tests that you may have heard of include ultrasound, amniocentesis and maternal blood tests. This form of testing also tends to be a more targeted form of testing. In other words, the types of tests performed are based on the mother's age and medical history, family history of certain medical conditions, or other concerns specific to each baby or each pregnancy. As a matter of fact, screening and genetic counseling may also be offered to a couple before conception, under certain circumstances. Speak with your obstetrician to learn more about prenatal testing and the types of tests he or she recommends for you and your baby.

NEWBORN SCREENING

Newborn screening is a more general type of testing that is performed the same way on every baby and is not targeted to specific issues or concerns. The actual procedure is quite simple. A small sample of blood is obtained by pricking a baby's heel, usually on the second day of life. The blood then dries on absorbent paper and is sent to a laboratory for analysis using sophisticated technology, such as tandem mass spectrometry. At my hospital, abnormal results are provided to both the hospital and the baby's pediatrician within 24 to 48 hours of birth.

Newborn screening also offers a simple, inexpensive way of determining whether a baby has a metabolic disorder that, if left untreated, could result in permanent neurological or developmental damage, even death. Metabolic disorders, which affect at least 1 in 1,000 babies born in the United States each year, are inherited genetic disorders that interfere with the body's ability to break down fats, sugars, or proteins in food.

Most babies born with these disorders look and act perfectly healthy at first. Without newborn screening, the problem is not discovered until the child develops symptoms, which is often too late to prevent permanent damage. While these diseases cannot be completely cured, they can usually be treated, reducing—and in some cases eliminating—the risks to the child. Treatment is often as simple as monitoring or removing the food that cannot be metabolized from the child's diet.

One of the more common of the metabolic disorders, and one for which all babies are now routinely tested, is phenylketonuria (PKU), characterized by the inability to process the amino acid phenylalinine, which is commonly found in protein-rich foods. Another is MCAD (medium chain acyl-CoA dehydrogenase deficiency), a disorder that affects the ability to process fat and may be responsible for up to 10 percent of deaths attributed to sudden infant death syndrome.

Ask the Doctor addresses issues of concern to our readers. Parents should review any suggestions made in this column with the appropriate professionals. Mention of specific products or medications illustrate suggestions and are not endorsements of any specific products. Send questions to: Ask the Doctor, EXCEPTIONAL PARENT, 65 East Route 4, River Edge, NJ 07661; Fax: (201) 489-0074; or E-mail: epedit@aol.com.

Others are maple syrup urine disease, a disorder in which several amino acids can not be metabolized properly; cystic fibrosis, the most common inherited metabolic disease among Caucasians; galactosemia, an inability to properly digest galactose, a type of sugar found in milk; and glutaric acidemia (Type I), a disorder of amino acid metabolism characterized by the build-up of glutaric acid.

EARLY IDENTIFICATION IS IMPORTANT

But early identification is the key. I am an avid supporter of newborn screening, particularly universal newborn screening, meaning all newborns should receive all available tests. Unfortunately, the rules in each state vary widely and currently many babies receive only very limited testing. (see EP Magazine, August, 2002 for a listing by state).

In fact, many states mandate evaluation for only four to six disorders. Some states, including New Jersey, where I live and practice, have adopted expanded newborn screening, For example, New Jersey recently expanded its list of mandatory tests from 4 to 14 metabolic disorders. I do not think that goes far enough. Right now, technology is available to test for more than 50 potentially treatable metabolic disorders. At The Valley Hospital in Ridgewood, we recently made the decision to contract with a private laboratory to test every single baby born at the hospital for these more than 50 disorders.

We also offer universal hearing tests. In most cases, the tests serve to reassure parents that their baby is healthy. And in those cases in which problems are discovered, parents can also take comfort in knowing that appropriate treatment was initiated days after birth, giving their baby the best possible start in life.

The good news is that efforts are underway to close the wide disparity in newborn screening guidelines among the states. And I am hopeful that universal newborn screening will become a reality in the not-so-distant future. But in the meantime, I urge you and other expectant parents to take matters into your own hands. You are, after all, your baby's best advocate.

First, find out what screening tests your local hospital routinely performs. If you are lucky, you will find a hospital in your area that offers screening for the full range of metabolic disorders. If not, talk to your obstetrician and pediatrician—they may be able to assist in making arrangements with a private lab for expanded screening. Or you can call a private lab directly to make arrangements to have your baby screened. EP

THE MELMARK SCHOOL
2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Our approved private day and boarding school serves children ages 5 - 21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Acquired Brain Injuries
- Cerebral Palsy
- Mental Retardation
- Neurological Disorders

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK or email admissions@melmark.org

GENDER DIFFERENCES IN ADHD

A nationwide survey released last month found that girls with ADHD face significantly greater challenges than boys with the disorder in the areas of social development and self-esteem. The survey was conducted by Harris Interactive on behalf of Novartis Pharmaceuticals; it looked at perceptions of gender differences in youth with ADHD among adolescents with the disorder (ages 12 to 17 years), parents of teenagers with the disorder, teachers and the general public.

Before being treated for ADHD, more girls than boys reported having trouble making friends, getting along with their parents and finishing schoolwork. Girls were also more likely to report difficulty in being happy and feeling good about themselves.

According to one estimate, nearly 75 percent of girls with ADHD may go undiagnosed, possibly because girls with the disorder show less hyperactivity and aggression than boys who have it. Girls are more likely to have subtler symptoms overall. These may include forgetfulness, anxiety, timidity and difficulty listening. Results also suggest that girls with ADHD are nearly three times more likely to be treated for depression than boys with the disorder: only five percent of boys taking medication for ADHD were on medication for depression before their ADHD diagnosis, compared to 14 percent of girls.

The parents of girls with ADHD are reportedly more willing to seek a medical opinion when it seems that their daughter might have the disorder—92 percent of girls' parents were "very willing," compared to only 73 percent of parents of boys. Also, parents of girls were half as likely to feel outside pressure when deciding whether or not to medicate their child.

For more information on the survey, visit: http://www.hirehealth.com/ci/servlet/com.ci.service.NewsResearch?VIEW DETAIL=1&NEWS ID=46060

NEW CENSUS FINDINGS ON DISABILITIES

Figures from the 2000 US Census show that one of every dozen children and teenagers in the U.S.—5.2 million people between the ages of five and 20 years—has a physical or mental disability. The census counted a total of 50 million people with disabilities in the US population. The decennial count covered a range of conditions, from mild asthma to severe mental illness or retardation; specialists say, however, that it probably understates the number of children with disabilities because the questionnaire did not include such conditions as minor speech impediments.

While these are the first census data collected on children with disabilities in more than a century, figures from other sources indicate that the number of children with disabilities is on a sharp incline. Special-education enrollment has risen at twice the rate of overall school enrollment in the last decade, and increasing numbers of children are receiving Social Security payments because of disabilities.

The reasons for this increase are uncertain, but several possibilities exist. One explanation is that the rise is due to the recent period of dramatic change in our approach to disabilities as a nation. The last ten years have seen the institution of the Americans with Disabilities Act (ADA) as well as the revision and continuing implementation of the Individuals with Disabilities Education Act (IDEA). These laws as well as others have helped to further a relatively new vision of inclusiveness, which is resulting in, among other things, more willingness to report disabilities.

Another factor may be the recent changes in medical care. For instance, low-birthweight and premature babies now have a higher chance of survival, but are still at greater risk of developing certain health problems or developmental disorders. Also, the rise of childhood obesity is leading to other conditions such as diabetes. These things and more lead to a growing population of children with disabilities.

Wider recognition and changing definitions may also affect the numbers. Conditions such as attention deficit disorder (ADD), which decades ago was not even recognized, let alone diagnosed, are now included in the disability category. Diagnosis of these conditions has become aggressive, and many more people may be stepping forward because of lessened stigma or the availability of benefits.

Whatever the reasons, the increase results in several challenges. National enrollment in special education services is actually higher than the census total. In addition, educators say that more children seem to have multiple disabilities, requiring more intensive services and incurring additional costs.

Since modern medicine is increasing the life expectancies of people with conditions such as cystic fibrosis, Down syndrome and spinal cord injuries, there is a growing need for services later in life as well. For instance, people with multiple disabilities who may not be able to work or care for themselves after graduation will need adult day care or residential placement. Situations such as this need greater consideration now.

These challenges are amplified in poorer areas. Surveys have shown that poverty can be linked to a higher rate of disability, although the reasons for that are still being debated. Experts offer several explanations, such as insufficient or non-existent prenatal care, a higher risk of premature birth, birth to a drug- or alcohol-addicted mother and the likelihood of increased exposure to lead paint, which can cause brain damage.

For more information on the 2000 Census, visit: http://www.census.gov/main/www/ cen2000. html

We now have a new monthly in depth look at reports and studies on issues that affect the special needs community. Each issue will feature information on the latest medical and scientific updates that apply to our readers.

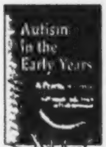
THE SPECIAL NEEDS BOOKSTORE

AUTISM

Thinking In Pictures
My Life With Autism
Temple Grandin with a Foreword by Oliver Sacks

The author is a gifted animal scientist who has designed one third of all the livestock handling facilities in the US. She is also autistic, a woman who thinks, feels, and experiences the world in ways that are incomprehensible to the rest of us. In this unprecedented book, the author delivers a report form the country of autism. Writing from the dual perspectives of a scientist and an autistic person, we learn how the country is experienced by its inhabitants and how she managed to breach its boundaries to function in the outside world. What emerges is a document that sheds light on the riddle of our common identity.

RH118AT **$17.00**

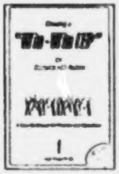


NEW

Autism In the Early Years
Resource Materials for Teachers: A Practical Guide
Val Cumine, Julia Leach and Gill Stevenson

Designed to provide parents and professionals with an insight into the nature and educational implications of autism, particularly as it presents in very young children. Also aims to equip Early Years practitioners and parents with knowledge of a range of intervention strategies to promote learning, social development, communication and appropriate behavior.

TT5992AT **$25.95**



NEW

Creating a "Win-Win IEP" for Students with Autism
A How-To Manual for Parents and Educators
Beth Fouse, Ph.D.

This Second Edition, has been written to provide parents and families of students with autism necessary information and skills to meet the challenges of the IEP process. This book takes readers through the child-centered educational process from the stages of initial diagnosis to implementation ad of student's individualized educational programs. Practical suggestions are provided based on federal and state legislative requirements, case law, and the many years of experience the author has in working with the process as a teacher, special education administrator, regional special education consultant and university instructor.

FH7287SE **$29.95**

NEW

A User Guide to the GF/CF Diet for Autism, Asperger Syndrome and AD/HD
Luke Jackson; with appendices by Jacqui Jackson; Foreword by Marilyn Le Breton

Luke Jackson, who is 12 years old and has Asperger Syndrome, tells you everything you need to know, both good and bad. He offers encouragement and practical advice on what to expect when beginning the gluten and casein free diet, how to alleviate any initial discomfort, and how to live with the diet.

Special People Special Ways
Arlene Maguire; Illustrated by Sheila Bailey

This book presents a positive image of persons with disabilities using a delightful rhyme and rich watercolor illustrations. It shares the message that even though each of us may have something different about us, we share many commonalties.

FH7651CH **$14.95**

If The World Were Blind
A Book About Judgement And Prejudice
Karen Gedig Burnett with illustrations by Laurie Barrows

This fascinatingly unique children's story is relevant to everyone, not just the children it is written for. You will find yourself asking how you view people, and what if, you couldn't view them at all?

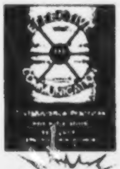
GRP3040VI **$17.95**

Always Kiss Me Goodnight
Instructions on raising the perfect parent
Compiled by J. S. Salt

Instructions on raising the perfect parent as seen in the eyes of 147 children. One of the most popular, entertaining, and insightful books a parent will ever find.

RN10900 **$7.00**

EDUCATION

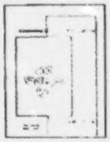


NEW

Effective Communication
Collaborative Practices For Educators
Strategies for Effective Communication
Patty Lee, Ed.D.

This new revised edition includes 60 strategies and 180 practice activities designed to improve communication and collaboration skills. The activities may be used in any order allowing you and your colleagues to focus on one specific area or work in several areas simultaneously! Covers six (6) critical areas: Developing Expectations; Preparing Ahead; Understanding Perspectives; Listening; Asking Questions and Speaking Clearly.

PP5267ED **$19.95**

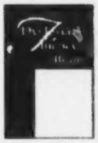


Cooperative Learning and Strategies for Inclusion
Celebrating Diversity In the Classroom
Jo Anne W. Putnam

This guide shows educators how to make group learning strategies work in their classrooms. There are chapters written by a distinguished array of professionals who reveal the real educational benefit of a cooperative learning environment.

PB167ED **$26.95**

DYSLEXIA



Dyslexia, Fluency, and the Brain
Maryanne Wolf

Consider the time it takes for the brain to process written language. What impact does the brain's processing time have on reading, development? What are the relationships among processing time, reading fluency, and dyslexia? Can time and fluency related problems be changed? How should intervention be designed to address the issue. This monumental resource presents evidence indicating that many dyslexic children have a second core deficit in rate of processing linguistic differences in multiple areas. This book has been constructed to bring several levels of evidence and types of research to bear on these questions.

YP26020Y **$30.00**

NEW

Learning About Learning Disabilities
Second Edition
Bernice Wong

Targeted for the advanced student and professional this text covers a wide range of topics to ensure a comprehensive and balanced coverage of important areas in learning disabilities. Included are conceptual issues, basic research in memory processes and social aspects of learning disabilities intervention research in academic areas and nonacademic areas, issues in service delivery and a life span perspective.

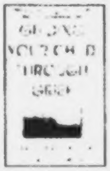
ACP5321LD **$59.95**

GRIEVING

What on Earth Do You Do When Someone Dies
Trevor Romain

A down to earth explanation for children about death. It offers many ways for children to cope with and understand what is happening.

FS4000E **$7.95**



Guiding Your Child Through Grief
Mary Ann Enswiler, MA, MRS, and James P. Enswiler, MA, M.Ed

This caring and compassionate guide offers expert advice during the difficult days to help a child grieve the death of a parent or sibling. This book helps readers understand the many secret ways children grieve and offers more insight information, and advice that can help a child heal.

BD0257GR **$13.95**

Remembering With Love
Messages of Hope for the First Year of Grieving and Beyond
Elizabeth Levang, PhD. and Sherokee Ilse

An affirming gift for those grieving the loss of a loved one, offering compassion, comfort and guidance with over three hundred short pieces written by those who have been there.

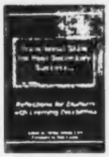
FP0400E **$11.95**

MENTAL RETARDATION

Mental Retardation in the 21st Century
Sponsored by The ARC of the United States, Edited by: Michael L. Wehmeyer and James R. Patton
An interesting and provocative prediction of where technology and society are headed with respect to the treatment of mental retardation in the coming century. Seven Sections covering Family Issues; Education Issues; Employment and Residential Issues; Psychology Issues; Medicine and Health Issues; Life Span Issues and Policy Issues.
PE181MR **$ 44.00**

The Burden of Sympathy
How Families Cope with Mental Illness
David A. Karp
This book captures the essence of caring and caregiving for society today. It carefully discusses the emotional and social forces that are at play when caring for a mentally ill person.
OU3158MR **$25.00**

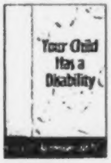
LEARNING DISABILITIES



Transitional Skills for Post Secondary Schools
Reflections for Students with Learning Disabilities
Rick Lavoi and T. Citro
A thorough, extensive resource that will prove to be an invaluable guide for parents and students with learning disabilities. This book not only helps students make the transition from the protective environment of home to the university campus but offers a roadmap, for making that transition, and the college years that follow, a success.
LD7110LD **$24.99**

Einstein and Me: Talking About Learning Disabilities
A Video for Parents, Kids & Teachers
Jerome J. Schultz, Ph.D.
An upbeat, informative and optimistic video of kids talking openly and honestly, telling about how they found out about their learning disability; policies and people who make life difficult; people and programs that helped them cope; their strengths and talents.
LD100LD **$99.00**

GENERAL

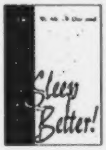


Your Child Has A Disability
Mark L. Batshaw, M.D.
When a child is diagnosed with a disability, parents can be overwhelmed by day to day physical and emotional demands. This comprehensive volume offers some welcome assistance with expert advice on a wide range of medical and educational issues.
PB160LD **$24.95**

The Don't Sweat Guide for Parents
Reduce Stress and Enjoy Your Kids More
Richard Carlson, PhD
This insightful guide provides suggestions for enjoying your children more while being less stressed and more present with them in every moment of their lives. Strategies that are discussed include admitting that you could use some help, learning to take a breather, keeping the job at the office; and many more.
TW7184PA **$10.95**

Is My Child OK?
When Behavior Is A Problem, When It's Not, and When to Seek Help
Henry A. Paul, MD
Every parent has asked this question at one time or another. This wise and compassionate guide offers reassuring words for worried parents as well as concrete ways to spot problems between a normal stage of development… and a true problem. This one step reference book tells parents what is normal, what is not, and where to get help.
RH8879GN **$13.00**

Pathways to Learning in Rett Syndrome
Jackie Lewis and Debbie Wilson
Parents and Teachers of girls with Rett Syndrome will welcome this extraordinary book that offers accessible advice on the special education needs of these girls. It also assists teachers in developing a working knowledge of the syndrome and suggests particular strategies in planning a curriculum which may help overcome the specific difficulties within the diagnosis.
TF5333RS **$26.95**

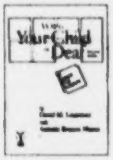


Sleep Better
V. Mark Durand Ph. D.
This text begins with a discussion of sleep followed by a description of a range of sleep problems and includes a step by step interview that will help you identify the type of problems being encountered. Includes treatment options covering bedwetting, sleep walking, insomnia and much more.
PB166GN **$23.95**

HEARING IMPAIRED

The Silent Garden
Raising Your Deaf Child Second Edition
Paul W. Ogden
An up to date reference comprising all the bits and pieces of advice, encouragement and hard data that parents might need in order to make decisions that will enable their children to grow into strong, healthy and productive members of society.
GU103DF **$29.95**

Kid-Friendly Parenting With Deaf and Hard of Hearing Children
A Treasury of Fun Activities Toward Better Behavior
Daria Medwid and Denise Chapman Weston
A step-by-step guide offering hundreds of ideas and methods designed to work with children ages 3 to 12 to enhance communication and strengthen relationships in skillful, fun ways.
GU101DF **$24.95**



When Your Child Is Deaf
A Guide for Parents
David M. Luterman with Antonia Brancia Maxon
This must read book provides information for parents about the emotional and educational processes of coming to grips with a hearing impairment in their child. Parents of newly diagnosed hearing impaired children as well as parents of a child with a hearing impairment at any age will find this book helpful.
YP2270HI **$17.95**

VISUALLY IMPAIRED

Children with Visual Impairments
A Parents' Guide
Edited: M. Cay Holbrook, Ph.D.
Designed to help parents get a handle on common types of concerns. Written by a team of professionals and parents, each of whom is an expert on a different aspect of caring for children with visual impairments.
WB1790D **$16.95**

Transition Issues Related to Students with Visual Disabilities
Jane N. Erin and Karen E. Wolffe
An explanation and analysis of the critical areas in the lives of those with visual impairments, such as transportation, academics, employment and recreation.

Circle #200

SUSAN

Susan T. Cheney, 20, graduated this past May from Jefferson Davis High School in Montgomery, AL with a 3.666 GPA, and was selected for inclusion into the 2001-2002 edition of *Who's Who Among American High School Students.* She has also received multiple awards from the Mayor of Montgomery, Bobby N. Bright, who proclaimed May 31, 2002 "Susan Tamara Cheney Day" as well as the Governor of Alabama, in recognition of her courage and achievements despite her disabilities. Susan has Spastic-Athetoid Cerebral Palsey and is non-verbal and non-ambulatory. Her parents, Marilyn and Bob Cheney, aide of 11 years, Kay Smith, and all the rest of her family and friends are very proud of her.

EARL

Earl Delk II, 2 1/2, was born with microcephaly. He is developmentally delayed, but doing well. Currently, Earl receives OT, PT, speech therapy, music therapy and special instruction. He also attends daycare twice a week for socialization. Earl enjoys car rides and crawling through the house. He lives with his parents, Earl and SaBrena, both RNs.

ALYSON

Alyson Lerch, 7, has Lissencephaly. She enjoys lights and sounds, toys, balloons and game shows. Alyson attends Auburn Elementary and likes to spend time with her brother, Cody, and sister, Bree-Anna. She lives in Auburn, Illinois, with her mom, Michelle, dad, Bruce, and her bother and sister.

DALLAS

Dallas Allyn Mahlmann, 4, loves watching TV commercials and being with his family. He wins everyone over with his cute, dimpled chin and huge smile. Dallas receives PT, OT and vision therapy. His parents, Keith and Sherry, are excited about him starting the Early Childhood school program in the fall. He was born premature and has Dandy Walker Syndrome. He uses a wheelchair, a walker, wears contacts and requires oxygen by nasal canula.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (Exceptional Parent), 65 E. Route 4, River Edge, NJ 07661. (Please do not send "one-of-a-kinds" as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

PART XV

VIGILANCE – INVOLVEMENT – PERSISTENCE

The Keys to Ensure Access to Dental Care

By Sanford J. Fenton, DDS, MDS, FDS, RCSEd, FADPD and Carlton V. Horbelt, DDS, FADPD

The true barometer of a society's ethical and moral values is the way it treats its most vulnerable members: its children, elderly citizens, people who are socio-economically disadvantaged and persons with developmental or other disabilities. Most ethicists therefore judge a society and its members on their deeds or actions rather than their words or rhetoric.

The issue of access to dental healthcare services for all Americans, including those with developmental disabilities (DD), is currently being debated at national, state and local levels. Participants in the debate include government officials and agencies, professional dental organizations, dental schools and dental auxiliary training programs, dental education accrediting bodies or agencies, advocacy organizations, the healthcare insurance industry, parents and/or legal guardians and, most important, individuals with disabilities.

Access to oral healthcare for persons with special needs remains a significant national problem. The decision by many states to close their institutions and relocate individuals to community-based residential facilities has actually added to this access problem. Many of the state institutions that were closed had provided comprehensive dental services through their onsite dental clinics. Closure of these institutions frequently resulted in the dismissal of the onsite dentists and ancillary staff, who often possessed years of invaluable experience. Persons with special needs who were moved to a community setting no longer had access to their professional expertise. The relocated individuals with disabilities and those with the responsibility for finding necessary dental services often discovered a lack of resources and knowledgeable care providers within the community. Continuity of care was frequently jeopardized when individuals with disabilities were relocated to community-based living facilities.

A national advocacy organization, The Voice of the Retarded (www.vor.net), noted that almost two-thirds of community-based residential facilities report that inadequate access to dental care is a significant issue. The Arc (www.thearc.org), a national organization representing people with mental retardation (MR) and related developmental disabilities and their families, reported that people with mental retardation have frequently been denied access to appropriate medical and dental treatment due to their disability. Furthermore, The Arc noted that medical and dental professionals are often reluctant to provide medical and dental treatment because they lack knowledge and understanding of the best practices in treating people with MR, DD and other disabilities.

A national conference called by the Office of the Surgeon General in December 2001 to discuss the issue of health disparities and MR highlighted the plight of many Americans with DD in attempting to access appropriate healthcare services, especially dental care. In the published conference report that followed, Tommy G. Thompson, Secretary of Health and Human Services, eloquently noted that

continued on page 110

continued from page 109

"Americans with mental retardation, and their families, face enormous obstacles in seeking the kind of basic healthcare that many of us take for granted. Unfortunately, societal misunderstanding of mental retardation, even by many healthcare providers, contributes to the terrible burden. Too few providers receive adequate training in treating persons with mental retardation." In this same report, Dr. David Satcher, then-Surgeon General, noted that everyone, including healthcare providers, must recognize the importance of listening to persons with developmental disabilities to learn what needs to be done. Dr. Satcher emphasized that "to listen and not respond with determined action will only heighten the injustice this community has too long endured." Before and during the conference, involved parents and persons with disabilities stressed the following points as major obstacles to accessing necessary healthcare services:

- Lack of provider training;
- Lack of coordination between providers,
- High turnover rate of direct support professionals (DSPs);
- Inadequate level of funding and diverse financial resources for necessary healthcare services.

Additional reports and publications have noted an inadequate number of dental professionals in the community setting willing to treat persons with developmental disabilities. Observations and data from nine years of dental screenings for thousands of athletes during Special Olympics events nationwide have further demonstrated the need to produce more dental professionals who are competent to provide comprehensive services for this seriously neglected population.

Two surveys of American dental schools conducted in the 1990s highlighted the lack of adequate didactic and clinical instruction. The results reported in the 1993 survey indicated that on average, only 12.9 lecture hours were devoted to the dental management of persons with disabilities in a typical four-year curriculum. Equally discouraging, the study found that fully 65 percent of the dental schools offered fewer than 10 hours of clinical instruction in the four-year curriculum. The second study, published in 1999, essentially duplicated the earlier investiga-

Camphill Special School
Children's Village
A not-for-profit residential school community where children with developmental disabilities are truly celebrated.

Is your child receiving a caring and compassionate education?

Since 1960, the families at Camphill Special School have invited children with special needs into their homes and into their hearts; living together as extended families they share the daily rituals of meals and chores, as well as the challenges of school and therapy.

Each House Parent has received specialized training and is prepared to nurture your child's capabilities and guide them toward a brighter future.

Serving students with developmental, medical and behavioral needs since 1981.

Circle #37 or visit www.eparent.com/adinfo

tion and found that in 53 percent of the schools, the number of lecture hours devoted to special care dentistry had dropped to fewer than five. These two studies clearly showed that dental students do not gain the expertise necessary to treat people with disabilities during their primary dental-education experience. In light of this, it is especially interesting to note that the Commission on Dental Accreditation (the agency responsible for accrediting all dental education programs in the US) eliminated from its Accreditation Standards for Dental Education Programs in 1996 document language that challenged dental schools to provide adequate student clinical exposure to persons with disabilities.

An inadequate level of reimbursement to dental practitioners further complicates the lack of access to necessary services by persons with disabilities. Providing dental services for this specialized population often requires more time and personnel, but third-party payers, especially Medicaid, usually do not reimburse providers adequately. The American Dental Association (ADA), Special Olympics, American Academy of Pediatric Dentistry (AAPD) and Academy of Dentistry for Persons with Disabilities (ADPD) have been working closely with government officials in an attempt to correct this problem. These professional organizations have also established partnerships with other advocacy organizations to address the insufficient number of dental healthcare providers in the field and the deficiency of adequate clinical training for future dental practitioners.

How has the inadequacy in primary training and reimbursement had an impact on individuals in this special population? This case study is just one example.

A twenty-year-old man with MR living with his parents presented with multiple restorable and non-restorable permanent teeth in obvious need of care. This individual was unable to access comprehensive dental services in his local community despite many attempts to find a willing dentist, although his multiple flare-ups of pain and oral infection over a six-month period were treated with antibiotics on several occasions. The parents were finally able to schedule an examination appointment for their son with a dentist who had advanced hospital dental training; he recommended a comprehensive treatment plan involving a same-day hospital general anesthesia procedure to complete all necessary treatment in one session. Unfortunately, acquiring all the information needed prior to the same-day hospital admission proved to be a nightmare. The patient's primary care physician was unable to provide an adequate medical history, although he cleared the patient for general anesthesia on the consultation request form he returned. The assigned anesthesiologist refused to accept this minimal health history and has continued to postpone the scheduling of this patient for general anesthesia. Financial responsibility for these medical and dental services rests with a third-party managed care organization whose pre-authorization policies and procedures for comprehensive dental services in the hospital setting are cumbersome and time-consuming for all the healthcare professionals involved. Inconsistencies in required documentation among the various healthcare professionals and the responsible financial agency have led to an inability to provide the necessary comprehensive dental services in a timely manner. The resultant fragmentation of responsibility for this patient's care has been detrimental to his well-being and quality of life.

Providing dental services for this specialized population often requires more time and personnel, but third-party payers, especially Medicaid, usually do not reimburse providers adequately.

Although it may not be easy to locate a dental practitioner who will provide comprehensive services for persons with DD, parents of children and adults with special needs can succeed in this most important endeavor by becoming a VIP: **vigilant, involved** and **persistent.**

How can a parent or DSP ensure that access to appropriate and necessary dental services will be available when needed for their child or adult dependent with a developmental disability? The first step is to educate yourself about the problem and the possible solutions by being **vigilant.** The Surgeon General's Report on Health Disparities and Mental Retardation is a good place to begin. Another federal agency with excellent information is the National Oral Health Information Clearinghouse (NOHIC), a resource for special care patients.

The second step is to become actively **involved** in your child's or adult dependent's dental care. Ask your dentist to demonstrate appropriate preventive techniques for cleaning their teeth

continued on page 112

continued from page 111

at home. For example, it may be necessary to modify brushing and flossing techniques or positions to accommodate the person's disability. Realize that individuals with special needs deserve the best that the profession of dentistry can provide. Extraction of teeth should only be considered for those teeth that are non-restorable (hopelessly decayed or fractured) or severely involved with periodontal (gum) disease. Restoration of remaining teeth and elimination or control of periodontal disease should be the overall goal.

The third step is **persistence.** If you are unable to access dental services for your child or adult dependent, contact the local or state dental society to solicit the names of dental practitioners in your community who provide comprehensive dental services for persons with disabilities. However, you may need to be willing to travel a reasonable distance to have your child or adult dependent examined and treated by a dentist who is competent to provide dental services for persons with special needs.

If you live within a reasonable distance from a dental school, contact the patient screening coordinator to see if your child or adult dependent can receive care at their facility. If you live near a university that has a University Center for Excellence in Developmental Disabilities Education, Research, and Service (UCEDD) on campus, contact the UCEDD for the name of dental practitioners who treat patients with disabilities in their dental offices. Contact the Association of University Centers on Disabilities (AUCD), which provides a directory of all of the UCEDDs. If you have exhausted all available resources and still cannot find a dentist willing to treat your child or adult dependent, contact the director of your state's Developmental Disabilities Planning Council and director of your state's Protection & Advocacy Agency for advice and direction.

The case study below demonstrates what can happen if everyone works together for the welfare of a person with a developmental disability. It is up to government officials and agencies at all levels, professional dental organizations, dental schools and dental auxiliary training programs, dental education accrediting bodies or agencies, advocacy organizations, the healthcare insurance industry, parents and/or legal guardians and, most important, those individuals with disabilities to ensure that this scenario is multiplied countless times in the future.

A thirty-two-year-old patient with severe mental retardation and cerebral palsy living at a state residential facility presented with a need to replace a missing upper front tooth lost due to previous trauma. It was decided that the best treatment approach for this individual would be a dental implant and crown. Under the supervision of the state facility's dental director, all necessary healthcare professionals involved in the planned treatment were notified, documentation—including a comprehensive health history and informed consent—was completed, and financial arrangements were coordinated in a timely manner. This led to a smooth and successful same-day general anesthesia procedure being performed within one month of the initial dental evaluation. This patient currently enjoys a functional and esthetic state-of-the-art dental restoration.

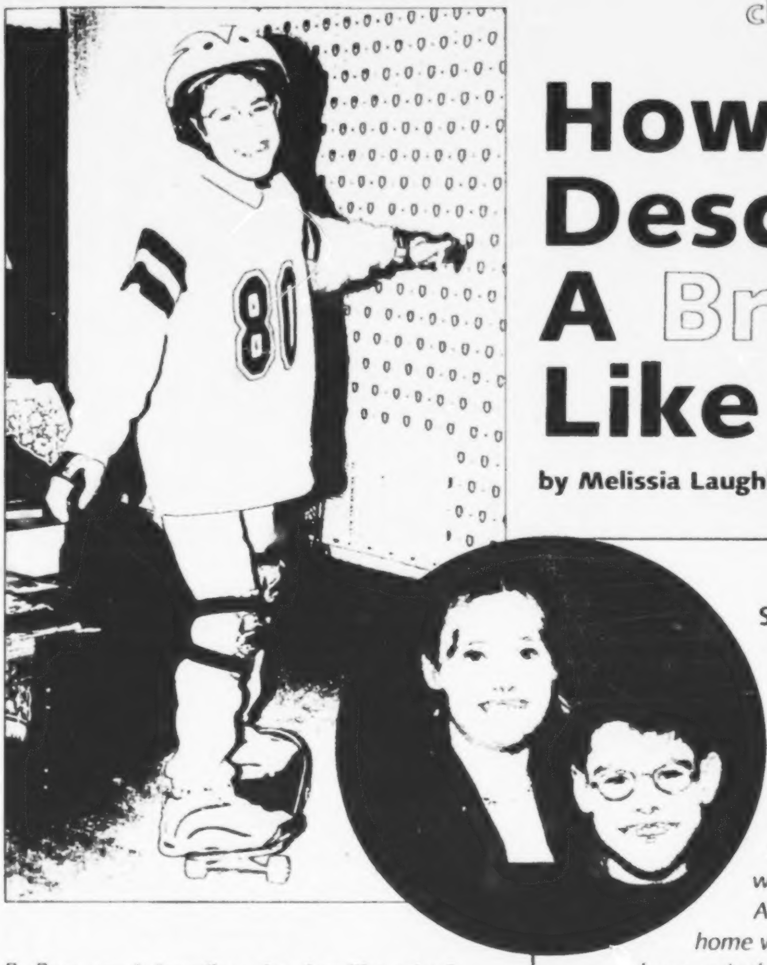
How Can I Describe A Brother Like Mine?

by Melissia Laughlin



MOM'S TURN

Sandra Birdsong, mother of Melissia and Daniel, writes:

Melissia, 14, is a very passionate and loving sister who cares deeply for her half-brother Daniel, 12. Like most teenage siblings, they bicker and aggravate each other to the fullest of their abilities. But Daniel misses her when she is gone and she becomes bored when he is busy or just behaving himself.

At the moment, Daniel and Melissia share their home with two dogs, Drake and Chigger, who also become jealous of each other!

Daniel receives speech therapy at home twice a week. At school, he receives more speech therapy, PT and OT. We are currently on a waiting list at the University of Arkansas for an evaluation for an augmentative communication device..

How can I describe a brother like mine? Sure, Daniel may not be completely normal; he may not be able to do stuff like most 12-year-olds do, but I wouldn't want him any other way! He has taught me to be true to myself, to have patience and, above all, to be thankful that I can do so much.

Daniel does not have to put on a mask in order to be recognized, like most teenagers do. He is true to himself and that brings out the sweet and loving boy that he is. No matter what is going on, he always has a smile on his face and a hug to give. Everywhere we go, we seem to run into someone who knows him; I'm not that popular! At times he has his moments of hitting and throwing fits, but these tantrums are his way of testing my patience. Anyone who has a sibling knows that fighting is normal! Each time he has a fit, it seems like I can cope with it better; I know this is true for my parents too. Sometimes I forget that my brother is different than other little brothers, and I wish he were normal. But then I stop and thank God that he has blessed me with someone like Daniel.

Of all the people I know, I think that the one I look up to the most is my brother. He goes through so much. People stare at him and let him down one way or another. Yet he still has strength in him to just smile and love life. So innocent. So pure. That is why I love him so much.

Daniel is like a small ray of sunshine in a dark world. If everyone would just stop and look, they would see what an amazing person he is. EP

A Better Bedtime Story

The Vail Enclosed Bed

Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt.
Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

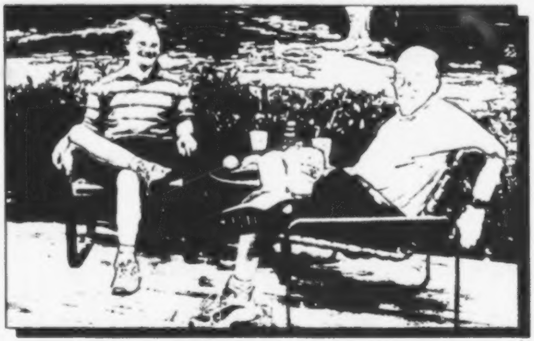
The Meadows at Melmark where...



Life begins at 21!

The Meadows Village Community was established in 1975 at The Melmark Home, a beautiful 80-acre campus located on Philadelphia's exclusive Main Line. At the Meadows adults live with their friends in their own supervised homes, perform meaningful work and have a full life of social, recreational and athletic activities. Self-esteem and enthusiasm for life grow as they experience success every day.

The Sound of Music

Celebrating life's achievements

The satisfaction of meaningful work

Challenging leisure activities

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

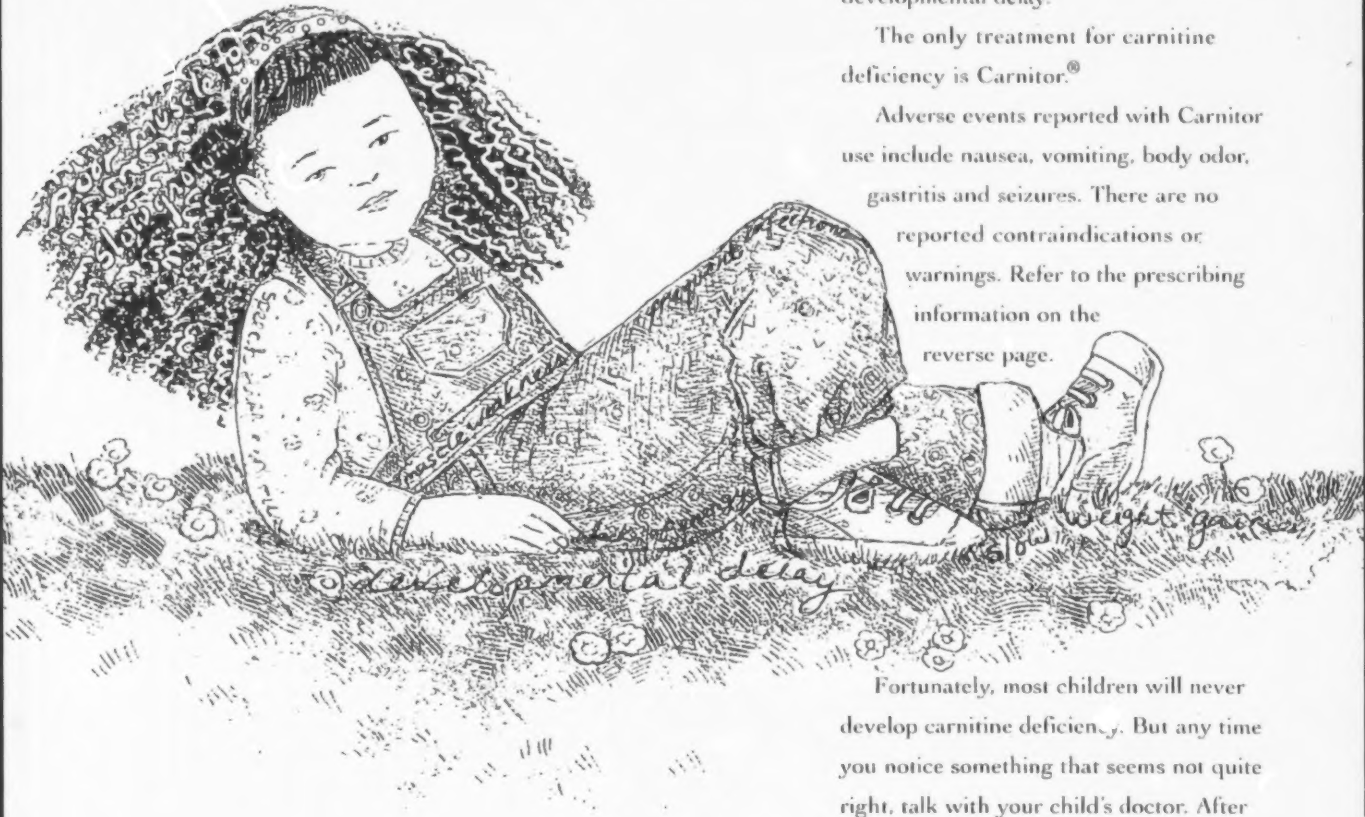
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

©2000 Sigma-Tau Pharmaceuticals, Inc. All rights reserved. PA-10

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

Bad Guessers and Bad Guesses

It's after the diagnosis. Physicians are most uncomfortable with it. They hardly offer it and at times waffle on it. It's not reimbursable and there's no code for it. Clinicians don't receive any training in it. It's usually preceded and succeeded by silence. No drug company has ever sponsored a lunch-time symposium on it.

But it's probably the one piece of information parents, spouses and patients cling to and refer to from that moment on. It has probably moved more people to action than declarations of war, memorable prose and unforgettable lyrics combined. It's the prognosis, and exceptional parents have heard every possible rendition, version and contortion of it.

Parents and patients might fear the diagnosis but it's the prognosis that serves as the mule kick to the head. The poet and novelist Sir Walter Scott remarked about the prognostication skills of physicians, "they are bad guessers." While it's true that specialists in oncology, critical care and traumatology probably have the most experience in prognostication, there are often large discrepancies in projected outcomes in identical cases.

Despite the contributions of biostatistics, medical informatics, disease staging studies and global pathological registries, the answer to the questions "how long," "how much," and "how bad" is guess-based, guess-driven and ultimately, guesstimated. The lingering question of "how come" is often also answered with a guess.

Nicholas A. Christakis, MD, PhD, a physician cross-trained in sociology, has examined the dynamics of physician prognostication. In his book Death Foretold, he notes that "there are three complementary ways in which physicians may understand and in the broadest sense, control a patient's disease: they can identify it, eliminate it, or predict its course. All three—diagnosis, therapy and prognosis—are means by which physicians come to terms, clinically and cognitively, with disease."

Exceptional parents, most notably the parents of children with abbreviated lifespan disorders (like the ones I rub shoulders with daily at Orange Grove), usually discard references to both their children's disease and therapy and relate to the time element. "Rick, I don't know how much longer Chad has, but for as long as he lives he will live with us," or "Rick, Robbie has already lived longer than anyone thought he would, we're now off the chart." "Rick, the pediatricians hardly ever look at me in the halls, not since they told me that Gwen wouldn't survive the night…and that was twelve years ago."

Dr. Albert Lamb wrote in the Journal of Chronic Diseases, "Patients and their families will forgive you for wrong diagnoses, but will rarely forgive you for wrong prognoses." Most parents of children with special health care needs are more interested in hearing that their physicians and health care teams will partner with them, will be there "the whole time," that their interest, energy, and attention won't diminish with any prognosticated shadows.

> *"The only thing I can say for sure about prognosis is that you are bound to be wrong—unless you are so vague that the prediction is meaningless."*
>
> *—An internist interviewed for Death Foretold*

Exceptional parents usually find themselves in the epicenter of prognostication. Their strategies, "Plan Bs" and energy stores pivot around answers to "how much longer," but not solely in the white-coat realm. "How much longer until the next level of insurance kicks in…how much longer till we know if he's inclusion bound…how much longer will we be on the waiting list?" The only thing that becomes predictable is the oh-too-familiar response, "it's hard to tell; we'll know better as time goes by." Try using that line the next time someone asks you, "how much longer till dinner's ready?"

For Exceptional Parents the prognosis is always something you didn't count on. ■

Search & Respond

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: EP Magazines, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S

Accessible Homes

I will be moving to a new house and want to build a wheelchair accessible ramp or deck. I realize that most counties mandate designs and that I will have to follow their requirements. Does anyone know where to go to find these designs or know of a web site or merchant that specializes in this field?

—DB via EP Web Site

S

Feeding Problems

I have two children that were diagnosed with Familal ExudativeVitreoretinopathy (FEVR) and are now both legally blind. My main concern is my son's eating habits. Since last year's emergency surgery to relieve the elevated pressure within one of his eyes, he has become hard to feed. He will only eat certain items and sometimes he will eat only one sandwich all day. He also has a habit of chewing on his bed sheet at night. Does anyone have any suggestions on feeding him?

—P via EP Web Site

I am the parent of a 14-year-old daughter with Down syndrome and longstanding hypothyroidism. My daughter is an extraordinarily picky eater. Extremely strong willed, she refuses to try any new foods, not even a taste. Consequently, her choice of foods is limited to four or five dishes. Does anyone have any suggestions or ideas to get her to try new foods?

—Anonymous via EP Web Site

We are the guardians of our ten-year-old granddaughter who has cerebral palsy, seizure disorder, cortical blindness and does not speak or walk. She currently takes Tegretol and Depekene three times a day to control her seizures, which has been working for about two years, but during this time period her appetite has almost disappeared completely. The one thing that was always a joy for her was her food and now she refuses to eat. We think that the medicine may be the cause but the neurologist disagrees. On days that the medications have been delayed in order to do blood work she seems to eat better. Has any other family had a similar experience with these medications and should we change medications in order for her appetite to return even though the seizures are under control at this time?

—DM via EP Web Site

S

Developing Fine Motor Skills

I am trying to work with my daughter on improving her fine motor skills. Though I want to have her work with small objects such as marbles, she mouths many of her toys. We are working on oral-motor skills to alleviate this problem, but while this therapy is underway I still would like to work on fine motor skills as well. I have been looking for an athletic-like helmet with a face guard for her to wear during fine motor work, but most are cumbersome and block her vision. I redirect her when she tries to put something inappropriate in her mouth, but sometimes she is quite fast and gets the object in before I can stop her. Does anyone have any ideas on a way to block access to her mouth while we work with small objects?

—Anonymous via EP Web Site

S

Aicardi Syndrome

My two-month-old daughter has recently been diagnosed with Aicardi syndrome. I am looking for information or support from other families with daughters who have this condition and I am particularly interested in information for seizure control.

Solutions for Daily Living
from Columbia Medical

Transporting

Since 1986, the **Columbia Orthopedic Positioning Seat** has been parents and therapists first choice in car seats. Suitable for children 20 to 102 lbs., it meets or exceeds all safety standards while offering the maximum in comfort, support and adjustability. Available with swing-away abductor, seat depth extender, buckle-guard and extensor thrust wedge accessories. Includes full-positioning pad set to customize fit and grow with the child.

Weighs only 11 lbs.

MOBILITY BASE

The Columbia Orthopedic Positioning Seat locks easily and securely onto the customized **Mobility Base.** The strong, lightweight frame offers three-angles of tilt and a height-adjustable footrest. Large wheels permit a smooth ride over any surface.

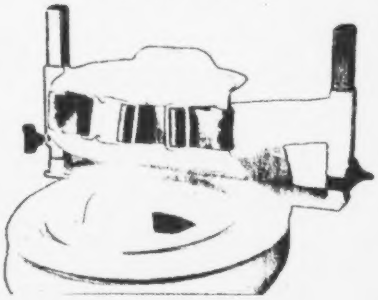
Bathing

Extension legs and casters are available to easily convert bath chair into a rolling shower chair.

Our NEW Fully Customizable Bath Chair, **Contour Ultima™** is completely configurable to meet an individual's unique needs. It offers the ultimate in positioning options and comfort. Available in four standard sizes and 192 custom-made combinations, the chair's seat, back leg length and seat width can be specified. The seat and back sections independently articulate providing full head and trunk support in both the sitting and reclining positions. Made of surgical grade stainless steel and replaceable ComfortMesh™ fabric. Includes two positioning belts for additional safety and security. The chair is sturdy, lightweight, easy to clean and fits in any standard tub.

Toileting

Our **Toilet Supports** attach and remove easily from any toilet. Available in both low and high backs, the supports can be used by children and adults.



Free Standing Bedside Positioning Commodes can be used independently or positioned over any standard toilet.

Columbia 800-454-6612 ext. 100

S

Car Safety

My daughter undoes her seat belt while riding in the car. We had a cover for the seat belt latch, but it has been misplaced. Does anyone know where we can buy another seatbelt latch cover or some other device to keep her safely belted in the car?

—Anonymous via EP Web Site

S

Cerebral Palsy Symptoms

My three-year-old son, who was born at full term after an uneventful pregnancy, was "diagnosed" with CP at 15 months of age. This was a clinical diagnosis, however, as both his head and spine MRIs were normal. Other than a delay in walking, which he didn't accomplish until 19 months, he met all milestones at the "normal" time. But now he has problems with spasticity in his legs and a weak trunk. I am just baffled as to how CP can just "show up" after having been a perfectly developed baby with normal range of motion skills. Is it common for CP symptoms to just appear out of nowhere and not have any damage show on the MRI?

Respond

R

Menstruation with Down Syndrome

DD, the mother of an eight-year-old daughter with Down syndrome, is looking for information on what to expect when her daughter begins menstruation.

My 16-year-old daughter with Down syndrome started her period when she was 11. She has been able to change her pad and likes to keep it clean. Although going to the bathroom is not a priority, she is annoyed when she waits too long. She now wants her menstrual flow to end sooner than it does. She has a friend with Down syndrome who receives a hormone shot to stop her periods from occurring.

—PZ via EP Web Site

I started worrying about my daughter's period shortly after her birth while she was still in the surgical intensive care unit, and prayed she would be at least 16 years old before she started. To approach the issue, I always allowed her to be in the bathroom with me and talked openly about periods. But I continued to worry. She is now 15 years old and started her first period about one year ago and has been successful in accepting and handling the functions of caring for herself. Our biggest dilemma right now is when she has her period over vacation. (She loves to swim.) I am currently looking for a gynecologist who will work with us to deal with that issue. Good luck! Your daughter will probably handle getting her period much easier than you ever thought.

—P via EP Web Site

R

Infantile Spasm Treatments

A has a one-year-old son with lissencephaly and seizures called infantile spasms and would like to hear from others with similar experiences.

We have a son who was in a similar situation. He is eight years old and is diagnosed with Miller-Dieker Syndrome Lissencephaly. Our son also experienced infant spasms when he was a baby, which were treated with ACTH. Unfortunately, two months later, the seizures returned and now our son has tonic clonic seizures. Dealing with his epilepsy is definitely a big issue for us. I have found some wonderful support through the Lissencephaly Network (www.lissencephaly.org). There is also a conference coming up next summer in Long Island, NY where you can find an abundance of information. The conference has physicians who are researching this condition and its effects. Current treatments for seizures are usually discussed. Also, the Network might be able to connect you to someone in your area that has a child with Lissencephaly like ours. I am so grateful to the organization for all the help it's given us in the past eight years and I'm sure it'll be a big benefit for you as well

R

Toilet Training

C has a four-year-old son with Duchenne Muscular Dystrophy and developmental delays who is having difficulty potty training. The doctor said that his condition should not be interfering with his ability to control his bladder or bowels She is looking for suggestions on how to improve his situation.

I am in the process of potty training our six-year-old, which I have continued to do for about two years. Our little girl has CP and the doctor said it would take a long while for her to feel and control her urges. At first I sat her on the potty every 30 minutes. If she happened to go, I rewarded her with a sticker, which she got to put on her poster. As she got better we upped the ante. She still has lots of accidents, but she can last 2 to 2 1/2 hours. I hope this has helped.

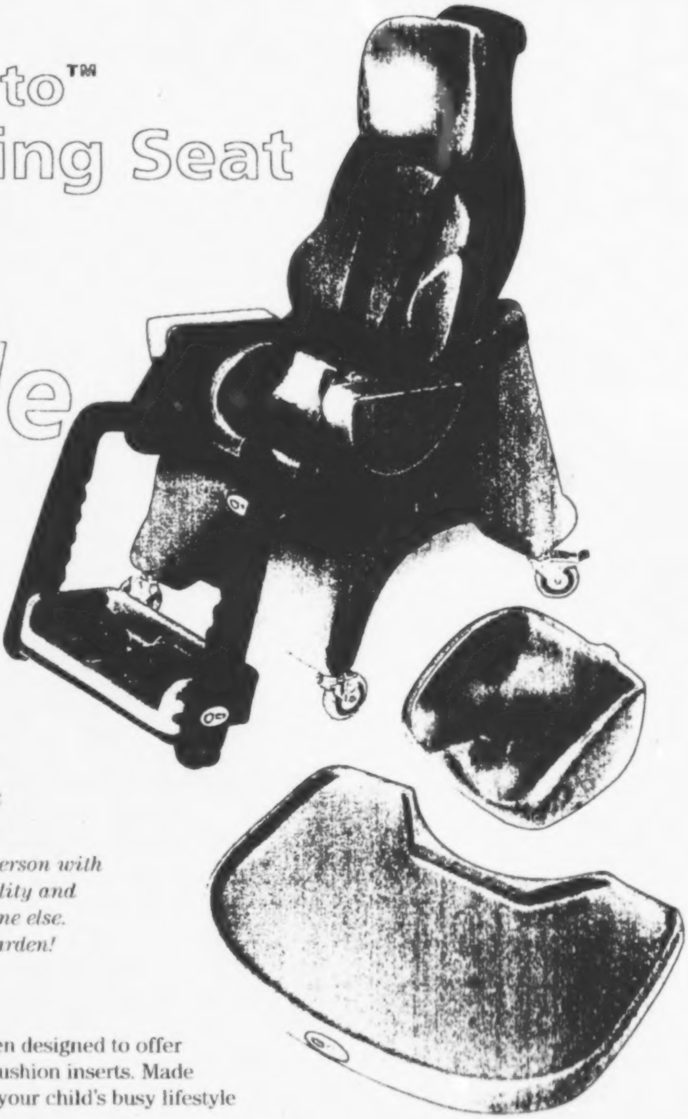
SPECIAL TOMATO

Special Tomato™ Multi-Positioning Seat

adjustable
adaptable
versatile



My dad and mom had four children. The first three were healthy and regular people. Then I came along; a baby with a difference—Down Syndrome.

One day it was bothering me that I was having a hard time doing my school work. My dad shared a story about his tomato garden. Once, at harvest time, a differently shaped tomato got his attention. It had a large, bright red bump that made my dad want to pick it up and study it because it was so unique and looked appetizing. At dinner, that tomato was just as juicy as the others.

Even though I'm different—like the tomato—as a person with Down Syndrome, my lovable and outgoing personality and strong character make me just as special as everyone else. I guess I am the special "tomato" in our family's garden!

The Special Tomato™ Multi-Positioning Seat (MPS) has been designed to offer comfortable and proper positioning support with its soft cushion inserts. Made for use at home, on the bus, at school, and anywhere else your child's busy lifestyle takes them.

Built to accommodate your child's growth, the unique design of the Special Tomato™ Multi-Positioning Seat allows you to make simple adjustments as needed.

Meets ANSI/RESNA WC/19 safety regulations for bus or van transport

Special Tomato™ Multi-Positioning Seat

The Special Tomato™ Multi-Positioning Seat (MPS) is available in three different configurations. Use the MPS with the Mobile Floor Base for use at home or in school. The MPS can also meet your bus or van transportation needs with the Push-Chair Base. If you prefer, the MPS can be purchased separately and attached securely to most standard chairs in your home, in the classroom, or in the community.

At home or school

continued from page 12

her three siblings and my parents (8 of us in all) to Disneyland a couple of years ago and she had the time of her life. The staff there was very sensitive to her needs and they were all well prepared to help us with her. We were not required to stand in long lines when it was hard for her and most of the rides had a seat that could be specially adapted to strap her in safely. We took it slow, and it turned out to be a great vacation for all.

—C via EP Web Site

School Yard Harassment

Anonymous has a 14-year-old son with mild to moderate mental retardation, speech difficulty and learning disabilities. He also has problems at school, where he is faced with harassment and bullying from other students. A would like to know how to encourage and build up confidence in him, as well as find out about anything the school can do to ameliorate the situation.

When a similar series of events occurred with my child, I got an Individualized Education Program, or IEP. I recommend that all your son's needs be met through formal written IEPs. Contact your local regional center for a no-cost advocate who will attend the meetings with you, support and help you. Also, ask for a one-on-one aide for the playground. My school had very sociable college students working with some of the special needs kids. They can help in most situations and in my son's case, his aide was so "cool" that the other kids began hanging around both of them at lunch. Even the kids who started as tormentors later became friendly and tolerant when they saw my son wasn't so bad after all. A lot of this teasing is out of fear.

As far as coping skills go, these can be learned with the assistance of the school psychologist (ask for help in this area) and private discussions at home. I always talk about forgiving people because they don't know better. This helps my son a lot and keeps him from holding grudges.

—DSO Via mail

Braces for Children with Down Syndrome

K has an 11-year-old daughter with Down syndrome whom the family dentist recommended get braces and K would like to know whether or not the outcome is worthwhile.

I don't have the answers when it comes to braces, but I can tell you that we are in the same position. Our pediatric dentist referred us to an orthodontist for evaluation of my 15-year-old daughter. Much to my surprise, the orthodontist was very optimistic about braces even though my child has many oral motor issues including tongue sucking, finger chewing, hyperactive gag reflex and others. The orthodontist believes that many of these issues will improve with treatment, which has not begun because of my daughter's baby teeth. He wants to wait for most permanent teeth to erupt, which shortens the amount of time she would wear braces. According to a friend of mine whose daughter has braces, the biggest difficulty is making sure that the teeth are clean behind and in between the fixtures. Good luck.

—PB via EP Web Site

Looking for Schools

Anonymous is looking for a school in which she can place her 15- year-old daughter who has multitple disabilities.

My son is 16 years old and has similar issues. He was born at 27 weeks gestation and suffered a Grade four intraventricular hemorrhage, seizures, spastic diplegia, total blindness and hydrocephalus. He now has scoliosis and PDD with self-injurious and aggressive behavior. His self-inflicted injuries have always been challenging for us and for the school system. After two hospitalizations in our state mental institution (no private hospitals would accept him due to the severity of his behavior and the multiple disabilities), we had an emergency IEP and the school searched the country with us to locate a residential school who would accept him. Many schools did not want to evaluate my son due to his blindness, which made him unable to fend off another student's attacks. The social worker found Heartspring School in Wichita, KS. They have had other students with visual impairments so they agreed to evaluate my son. Our experience with Heartspring has been very good. It is difficult to know your child is having painful issues and you can not be there to comfort them. Heartspring does a fantastic job at learning about the child's interests so they feel morecomfortable.

BM via EP Web Site

COMMENTS NEEDED

If you have experience with the following situations—as a parent, a professional, a direct support professional, a patient—**EP Magazine** would like to hear from you.

Multiple conditions (comorbidity) in which drug therapy was utilized. In particular, we are interested in epilepsy, autism and other neurological disorders, but the survey is not limited to these conditions.

We would particularly like to know about comorbidity of depression, autism and ADD/ADHD.

Please send a brief summary of your experiences to epedit@aol.com. Include your name, email address or phone number. You may write to:

Laura Apel
Assistant Managing Editor
EP Magazine

HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald & Her Son Nicholas

The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs, as well as locating your nearest HARD dealer, please give me a call.

The KANGOO

Imagine a product that lets you jog with your child through a park, take her for a bicycle ride through your neighborhood, or let him experience the joys of cross country skiing...You've just purchased a Kangoo, the only mobility base that provides these opportunities. The Kangoo allows your child to experience the outdoors like no other product.

The Kangoo easily folds to fit into the trunk of your car or store in the closet. Made from high-grade aluminum, it is light enough for anyone to handle, and durable enough to provide many years of use. A high quality shock absorber provides optimum comfort for your child even when traveling over the roughest of terrains, and the high quality wheels and axles require minimal effort to push the Kangoo.

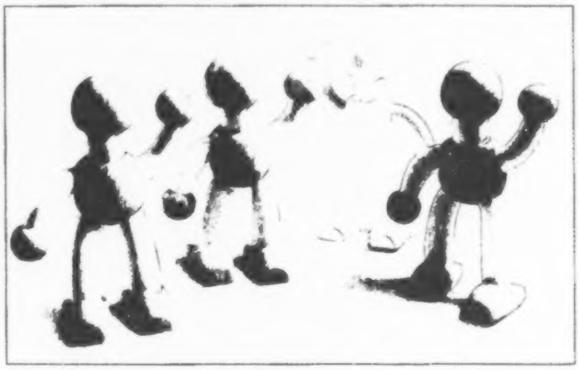
NEW TOY FOR ALL



Roundheads, created by Roundheads Worldwide, is a new line of safe and simple toys for children of all ages. These pose-able foam figures are the end product of five years of research, development and market testing, and are now available in stores nationwide. The toys come in a variety of figures, from adult Roundheads, to the soon to be added Roundkids and Roundthings, which include the flying Flapdoofus and turtle-like Tortoogus. For more information on Roundheads, Roundkids, or Roundthings, contact Roundheads Worldwide, 203 Main Street, Suite A-187, Flemington, NJ, 08822 or visit their web site at www.roundheads.com.

Bike Expo and Sports Jamboree

More than 30 different specially modified bicycles were featured in the Bike Expo and Sports Jamboree in Minneapolis, MN on September 21, 2002. Two organizations, both with the mission of empowering people with disabilities to reach their full potential, paired together to sponsor the event. Gillette Children's Specialty Healthcare is a not-for-profit hospital in St. Paul, Minnesota with clinics in Minnetonka, New Brighton and Northern Minnesota. It focuses on individual long-term healthcare needs. Courage Center is a non-profit organization providing rehabilitation, enrichment and independent living services for people with disabilities. The event highlighted bicycles designed to best-fit people's needs that are not available in mainstream stores. Among the units displayed were three wheelers to help stability and handcycles for people with no leg use; others had velcro foot straps to assist those with limited muscle control. Also shown were alternative seats, belts, handlebars and steering devices. Other demonstrations of adapted sports were held at the event including archery, martial arts, swimming and wheelchair basketball.

New Information Outlet Now Available

The National Council on Disabilities (NCD) has created a new electronic informational list to assist with issues such as affordable housing, employment, transportation, healthcare, education and assistive technology. The NCD is an independent federal agency that takes pride in reaching out for equal opportunities to individuals with any kind of disability. To receive approximately five emails a month of helpful information simply send a blank e-mail to: add-bulletin@list.ncd.gov.

Adaptable Products

Ableware makes everyday items such as this scooper plate with suction cup base. It is specially designed to assist individuals with limited muscle control. The high, curved rim makes it easier for a child to spoon feed him or herself. The bottom of the dish has a rubber suction to prevent the dish from sliding. PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

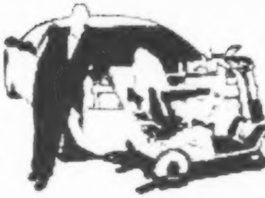
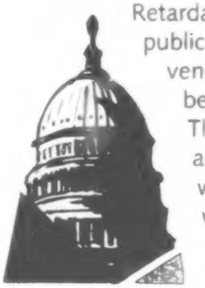
New Advanced Interior Scooter and Wheelchair Lift Hits Market



Vintage Mobility International launched a new interior scooter and wheelchair lift called the Excel 200. It has more advanced features than most other mobility devices, is adjustable in five different places, enabling it to fit in both large and small vehicles, and is accessible to city parking. The Excel 200 is the only mobility machine in its class that can perform curbside parking. Inside the house, the chair or scooter lifts automatically. For more information visit their website at www.vantagemobility.com

Forum on Developmental Disabilities in Washington, DC.

The Administration on Developmental Disabilities (ADD) will hold an ADD Commissioner's Forum at the Mayflower Hotel in Washington, DC from February 18th through the 20th, 2003. Here, representatives from the American Association of Mental Retardation (AAMR), the ADD, and other public and private organizations will convene to discuss issues affecting members of the special needs community. These include the quality of service and support provided to individuals with developmental disabilities, as well as the lack of qualified direct support professionals.



In addition, members of the ADD are interested in hearing about particular programs throughout the country that successfully deal with the issues at hand, so that these programs may be highlighted throughout the forum. The programs may be nominated under either the Quality Management or Workforce Development categories or both. For more information, you can contact either Sue Suter of ADD (202-401-6300), or Steve Eidelman, Executive Director of the Arc, at eidelman@thearc.org (301-565-5469).

Caregiver Story Project

The National Family Caregivers Association (NFCA) is launching a Caregiver Story Project. They want to hear from family caregivers, professionals, parents of special needs children and those involved with elder care. The goal of the project is to provide a forum for all caregivers to let others understand what their lives are truly like, discuss issues and share concerns. To submit a story visit http://www.nfcacare.org click on the story project icon and follow the instructions. You can also view sample stories.

COMMUNITY SURVEY

The Rosalynn Carter Institute for Human Development (RCI) is an organization centered on studying the components of a quality caregiving community. Recently, RCI decided to start up a survey where people can present their ideas on what such a community may entail. In order to contribute to the survey, log on to the RCI web site at http://rci.gsw.edu/CommunitySurvey. For more information, contact Ronda C. Talley, Executive Director & Professor at the Rosalynn Carter Institute for Human Development, Georgia Southwestern State University, 800 Wheatley Street, Americus, GA 31709, or call 229-928-1234.

3rd Annual World Congress and Exposition on Disabilities Honors Ridgeway School

Ridgeway Elementary School was honored by EP Magazine at the 3rd Annual World Congress and Exposition on Disabilities. The award for Educational Institute of the Year was presented at the closing ceremonies of the event in recognition of the schools great achievements in the education of students with disabilities.

The Medical Nutrition hospitals trust. Delivered to your door by someone you trust.

RECOVER
Strengthen the Immune System For A Faster Recovery
DIABETISHIELD

Welcome to the *NEW* Resource® Medical Nutrition Center -
exclusively at www.resource.walgreens.com

Now you can have Resource® Medical Nutrition supplements that hospitals trust - conveniently shipped straight to your home by Walgreens, *The Pharmacy America Trusts®*.

Clinical performance, great taste

Health Care Professionals recommend Resource® Medical Nutrition because it works, but you'll choose Resource® for the way it tastes. All our products come in easy-to-use packaging, making Resource® as simple to enjoy as it is to obtain.

Our prices go down easy, too

Resource® Medical Nutrition products are priced competitively with other brands, and standard shipping is FREE on orders of $50 or more*. Plus, we'll rebate 50% off of one order, up to $20**.

Order now

Visit **www.resource.walgreens.com** or call **1-800-828-9194** to place your order or request a program catalog. You'll discover we not only promise the best Medical Nutrition - we deliver it.

NOVARTIS

NOVARTIS NUTRITION
To improve lives. To extend lives. To save lives.

Walgreens.com®
America's Healthiest Web Site™

We offer Resource® Medical Nutrition for the following health conditions:

General Nutrition Supplements • Before/After Surgery • Cancer • Children's Nutrition • Diabetes • Digestive Conditions • HIV/AIDS • Fluid Restriction/Concentrated Nutrition • Kidney Disease/Dialysis • Pulmonary (Lung) Conditions • Swallowing Problems • Wound Healing

As always, consult a Doctor or Dietitian regarding Medical Nutrition support.

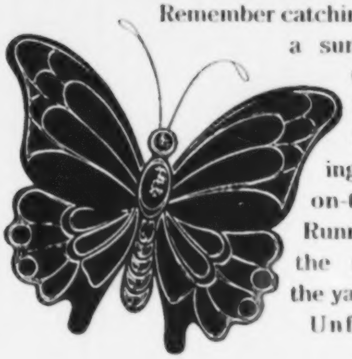
Recapturing the Joy

Finding Fun and Enjoyment in Each Day!

by Patricia J. Brown, Monica Uhl, Jill Baughan

"People tell me I'm handling all this so well," said Meg. "They have no idea that I just put on my 'happy face' when I leave the house. To be perfectly honest, there are days when caring for David so overwhelms me that I don't even want to get out of bed. I just want to take a vacation back to the days when I had no worries, no cares—nobody to think about but myself."

Who among us hasn't longed for that total abandonment of time and responsibility, even if it's only for a little while? How often do we as adults take time to really let go, relax and play? Remember catching fireflies on a summer night? Going to birthday parties and playing Pin-the-Tail-on-the-Donkey? Running through the sprinkler in the yard?



Unfortunately, these are only memories for most adults. Many of us have lost—or at least neglected—the art of playing and the joy of spontaneity, and it's no wonder. Parents of children with disabilities have an endless list of "things to do;" not only must we care for the child with a disability, but also for other children, and maybe even aging parents. Not only must we make a living, but also maintain a household and all the relationships within that household. And these days, voice mail, e-mail and cell phones—all designed to save us time and energy—often instead create a sense of urgency in our lives that makes it even harder to keep up. Too many things demand our time, and we don't have a minute to waste. It's not surprising that getting respite from our caregiving responsibilities seems impossible to accomplish!

Guilt also keeps some folks from taking a break—guilt that may come from leaving a child with a disability in someone else's care. But Susan, mother of seven year-old Wayne and three younger children, says, "I hire a sitter one day a week. I may not be gone for the whole time, but I may run, shop, meet a friend for lunch. And the time I spend away from my child makes me a better mother when I come back."

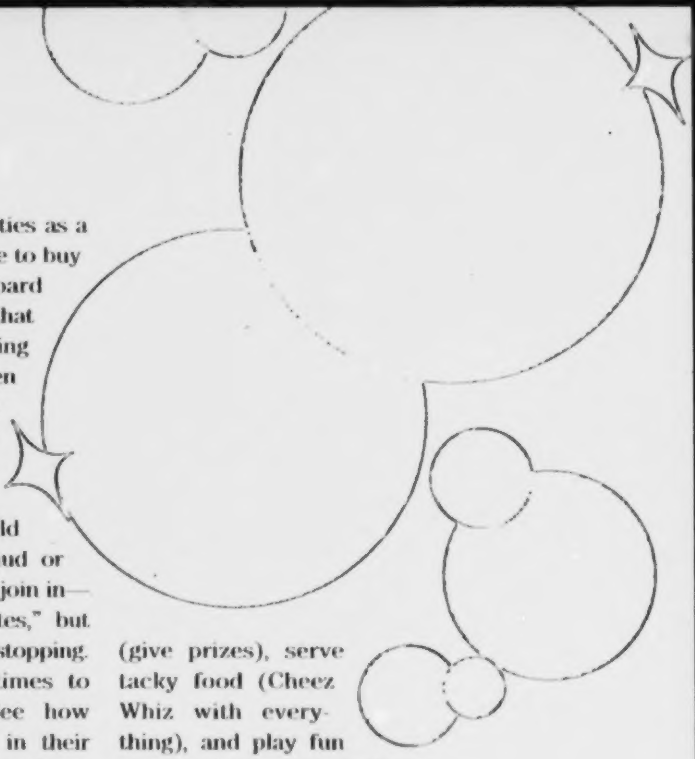
Certainly this time away is important—even vital—to maintaining a sense of self. But there's still another reason to develop a daily habit of play, with and without your child, and that's to deal with the stress of a major life change. Your life may have been ordinary a few years ago. Then your child was born, things were not as expected and all your idyllic dreams of parenthood evaporated as reality stormed in:

Endless appointments with doctors and teams of professionals. Will this ever end? I'm the parent. Why do I feel like the one with the least control here?

The medications. Am I giving him the right amount? Is she getting this at the right time? What if he has a negative reaction?

Educational planning. I never

1248



heard of an individualized education plan before; now all I hear is IEP.

Talk of respite. I really do need a break from all of this, but how? When?

The countless details that can pull the most positive person into a negative hole.

The stresses that accompany such a major life change can even be detrimental to your health. Negative thoughts and feelings can suppress the production of endorphins in your body, and thus make you more susceptible to illness. And over time, these same negative thoughts and feelings can convince you that life is nothing but serious.

Caregiving issues have become so important to so many people caring for children with special needs, ill family members, or aging parents that the National Family Caregivers Association was developed to focus on just this issue. The NFCA stresses the importance of self-care so caregivers stay healthy, physically and mentally. Caring for yourself can help you be a better caregiver, while also helping you to recapture joy in your life. Self-care includes remembering that there can be a lighter and more joyful side to life. Learning how to develop a playful attitude can help you take the time and break you need. Here's how:

Let Go of Time

Ironically, you might have to plan a specific time to let go, but so be it. Don't be afraid to block off a period and intentionally forget your watch. Or decide to relax and play until you're really ready to quit. This can work especially well if you choose activities as a family. Susan makes sure to buy a couple of active board games with simple rules that the whole family, including Wayne, can enjoy. Then her family spends one evening a week playing for as long as the children want.

Similarly, if your child wants to play in the mud or dance around the house, join in—not for "just five minutes," but until you really feel like stopping. Take a moment sometimes to watch little ones. See how absorbed they become in their own play, and you'll find that it really is possible to suspend time, even if just temporarily.

Be Spontaneous

So maybe it has been a while since you dusted under the bed. Or your schedule may dictate that you've got to clean the house. Society may pronounce you "too old for that stuff" when you act on a desire to turn cartwheels in the yard. But spontaneity, another prerequisite of play, has its own reward: liberation.

Try to respond to the voice that's telling you what you really want to do, with or without your child. Blow bubbles or fly a kite; go to the library and drink in the silence; go out to breakfast alone and savor that second cup of coffee; take a scenic drive on your way home. Indulge your whims and explore your creativity. Invite some friends over for a no-stress evening.

Celebrate a birthday—or any day—with a Tacky Party. Encourage guests to wear the tackiest clothes they can find (give prizes), serve tacky food (Cheez Whiz with everything), and play fun and physical games such as Hide and Seek or Name That Tune. You can have a basic plan for an evening and still be open to a lot of surprises!

Maintain a Sense of Humor

This should make it easier to keep your sense of humor, a third precursor to play. If you've forgotten or you're out of practice, it's necessary to relearn how to be silly. And if you're afraid of looking foolish when you're acting silly, consider this: much of play's therapeutic value comes from a childlike vulnerability that delights in the absurd. As long as you're having fun, who cares if you look goofy?

So go ahead. Dress up like a leprechaun on St. Patrick's Day or like Cupid on Valentine's Day. Sing on someone's answering machine. Walk in the rain with your bathing suit on (fun for singles, married people, families and entire neighborhoods). Once you get the hang of being silly, it may become second nature to

continued on page 26

continued from page 25

you and, at least for a while, you can take yourself lightly.

Your home can even reflect and encourage your sense of humor. Try setting up a "humor corner," an area where you post cartoons, pictures, stories—anything that makes you smile. Or decorate with humor. Lay a pair of "Groucho" glasses in the bathroom that everyone (especially visitors) uses. You'll be surprised at the number of people who emerge from the bathroom in those glasses. Be sure to take a picture of everyone that does, and start a photo gallery in your humor corner. Martha Stewart may not be impressed, but she's probably not a regular at your house anyway.

Take Some Risks

Finally, playing might well involve trying something new, so don't be afraid to take some risks. Be a participant, not a spectator. Helen, for example, has a son who is old enough to be in the youth group at church. However, he is far behind the other teenagers in emotional and intellectual maturity. In search of a way to help with the group and at the same time find a place for her son Chad, Helen enrolled in and graduated from clown college and led the clown ministry, which included her son.

Is there something you've wanted to do but never felt you had the time to pursue? Canoeing? Rock climbing? Backpacking? Writing? Maybe you'd want to take a class or, if that's too much of a commitment, a workshop in an activity that would be pure pleasure for you. And remember, you don't have to be good at something to have fun doing it.

Keep a Positive Attitude

One final requirement for a playful mindset is an upbeat attitude. Granted, this is easier said than done. But try this: At the end of each day, in a special notebook designated for just this purpose, take five minutes to write down a few of the day's pleasures. Sometimes this takes some serious digging, but even the worst days have their redeeming moments: a soak in the tub, extra cheese on your pizza, "I love you" in word or deed from someone you care about. Especially during low times, there's something very healing about filling an entire book with the rightness of life. Then make a list of ways you'd enjoy playing (by yourself, with your spouse and with your family), post it somewhere visible and make sure to play a little every day. It's true that hanging a spoon off the end of your nose won't make life trouble-free, but finding the fun stuff in life might give you a lift and make this business of living just a little more joyful. **EP**

Dr. Patricia Brown is the associate dean for academic programs at the School of Continuing Studies, University of Richmond in Richmond, Virginia. Pat is the mother of a 25-year-old son, Patrick, with Cri Du Chat syndrome and has dedicated her life to empowering people with disabilities. She has published articles, chapters, and given speeches in the United States and Brazil. She recently won the Bonner Scholar Story Award at the University recognizing her work toward the elimination of discrimination against people with disabilities.

Monica Uhl is the Project Director for the Respite Resource Project at the Partnership for People with Disabilities, a university center for excellence in developmental disabilities at Virginia Commonwealth University in Richmond, Virginia. She grew up with a sister with special needs and has worked in Virginia and Connecticut for over 22 years with various disability organizations.

Jill Baughan is an adjunct instructor of English at Virginia Commonwealth University. She also works as a worship assistant at Cool Spring Church in Mechanicsville, VA. She is currently working on a book that encourages people to relearn the value of play. She lives in Mechanicsville with her husband and spends most of her time trying to figure out how to turn work into play.

They Have A Lot to Say...

and you can be the one to help them say it.

Since 1983, DynaVox Systems has been committed to helping individuals with speech, language and learning disabilities to lead fuller, more independent lives.

Our products are a part of a broad group of communication methods called *augmentative and alternative communication*, or AAC. DynaVox AAC devices help thousands of young people with speech disabilities due to cerebral palsy, autism, mental retardation and Down's syndrome to express themselves.

As the AAC industry leader, our success is based on a strong partnership with our customers. Our foremost objective is to ensure that our customers receive the best solutions to meet their immediate and long-term communication needs. This is enhanced by a comprehensive network of support services including:

- ***Funding Assistance***
- ***Product Training and Support***
- ***Expert Field Support***
- ***Telephone Customer Support***

All DynaVox associates are committed to the development of innovative services. Together we can achieve our goal as we continue to improve the lives of individuals with speech disabilities by bringing them the power of communication.

The Healing Powers

By Laura Apel

There is a cliché that laughter is the best medicine,

but Sherry Dunay Hilber and RX Laughter are proving that it just may hold true.

RX Laughter is the first project ever to use humor as a healer for children and adolescents being treated for serious conditions such as cancer, cerebral palsy, congenital orthopedic problems and burns. A national non-profit research, therapeutic, entertainment and health-education organization presently in its third year at the UCLA Jonsson Cancer Center, Mattel Children's Hospital and the Neuropsychiatric Institute and Hospital, it was founded by former primetime television network executive Sherry Dunay Hilber. She wanted to use her experience in overseeing comedy programs to help the seriously ill.

Such stars as Emmy award winner Ray Romano from CBS' "Everybody Loves Raymond," Kevin James from CBS' "King of Queens," and comedians Wendy Liebman and Steve Mittleman supported this effort by performing in September at the Comedy Central Benefit for RX Laughter at UCLA.

As Hilber explains, "I have always believed that comedy programs are an emotional and physical healer." She took this idea and chose the UCLA School of Medicine because of their reputation for finding innovative ways to integrate emotional healing into the medical environment.

RX Laughter relies on very basic human tendencies and emotions. Funny videos of carefully selected television shows and films are integrated into the medical environment and are shown to children and teens undergoing medical procedures. The basic concept is to improve immune system functionality and speed of healing, reduce incapacitating pain, alleviate stress and improve the patient's quality of life. Severe anxiety, fear and isolation, common feelings among these patients, are addressed.

The videos are prescribed as a part of the individual medical plan utilized for the patient and research has shown that a positive attitude can provide a better chance of recovery. The American Medical Association briefing of February 21, 2002 reflected this in its statements that children and teens are better able to withstand painful procedures as they watch and laugh at the funny programs.

Two UCLA pediatric cancer researchers and physicians, Dr. Margaret Stuber and Dr. Lonnie Zeltzer, became great supporters of the organization, and with Comedy Central as seed funder, with $75,000 for the first two phases of a five-year study, the project is moving forward.

The success of the program overall is due to the merging of its three different components:

✲ THE RESEARCH COMPONENT

The main goal of RX Laughter is to help children and their families better deal with treating life-threatening illnesses. There is a concentration on examining how the immune system performs in response to the tapes: in short, seeking clues as to how the child can heal better and with less pain through the use of laughter. The doctors' research centers on whether natural killer cells in cancer patients can be improved to

# of a Good Laugh

enhance the body's ability to fight tumors and whether there is a correlation between the degree children watch the tapes and the buildup of their immune system. The research explains which kinds of humor, for which patients, under which circumstances will aid in pain management, improve immune function and reduce overall stress and anxiety.

* THERAPEUTIC ENTERTAINMENT COMPONENT: THE RX LAUGHTER HOSPITAL NETWORK

This component works in conjunction with the research component because, as the information is gathered on how humor can improve various functions and healing abilities, these findings are then applied and put into use through the RX Laughter Hospital Network. The goal here is to make the hospital experience less frightening or stressful and more manageable for both the patient and family. The Network carries comedy programs that have been shown to be both physical and emotional healers.

* COMEDY HEALTH EDUCATION COMPONENT

Because most children undergoing serious procedures and treatments are not intellectually or emotionally capable of truly understanding their illnesses or subsequent treatments, it becomes an even greater challenge for them to obtain the motivation needed to heal. When standard health education videos are used to inform the young patients, researchers have found an uncaptivated and disaffected audience. However, when specifically produced Comedy Health Education Videos are utilized, the children are entertained and simultaneously, educated about their particular illness. The videos are constructed from the perspective of the patients so that they are learning about their own illness and treatment plans through the words and thoughts of others just like them.

The RX Laughter organization has already made great strides in the medical world through its research and projects. The latest findings have shown that healthy children have a greater ability to withstand painful medical procedures longer and with less overall stress and anxiety as they watch the chosen videos. The therapeutic effects alone constitute a great success for the program, as both the children and their parents have found the incredibly difficult experience of treating these illnesses somewhat assuaged by the humorous videos and the act of laughter.

Dr. Stuber believes in the RX Laughter project and the benefits that humor and comedy can have on treating illnesses. She feels that the parents, as well as the children, can truly find comfort and hope in the act of laughing. As she recommends to the many parents who are forced to deal with the pain of having a child who is seriously ill, "Try to laugh with your child. Use laughter to get out of a confrontation or a grim moment. It will make both of you fell better. Laughter may indeed be the best medicine."

To give a donation to the RX Laughter program or to learn more about the organization, please visit www.rxlaughter.org., or call 310-206-3932.

the Land of Oz:

Parents'

for Managing Life

By Kate Scorgie, PhD and Lorraine Wilgosh, PhD

n her book *When the Heart Waits*, Sue Monk Kidd portrays Dorothy's journey in *The Wizard of Oz* as an allegory for overcoming life crises. Until the tornado came, all Dorothy had ever known was her simple life in Kansas with Toto, Aunt Em and Uncle Henry. When the devastating event occurred, Dorothy was catapulted from her familiar surroundings to the often-bewildering Land of Oz.

The remainder of the book was the story of Dorothy's profound longing for her home and her subsequent wanderings through Oz in order to find it. Dorothy was told that the way home would involve a very long journey, "through a country that is sometimes pleasant and sometimes dark and terrible." Kidd reminds us that at some time in our lives, each of us will encounter a "tornado" experience and, like Dorothy, we may find ourselves in a strange land with no road map and few recognizable landmarks, longing for our former, familiar lives.

Dorothy navigated her way through Oz with the assistance of three new friends she met along the way: a Scarecrow who needed a brain, a Tin Man looking for his heart and a Lion seeking courage. Kidd claims that these characters are sent to remind us that in the midst of any life crisis, what each of us needs for safe navigation "home" is a new way of thinking, a new way of feeling and a resolve to persevere.

For the past several years we have been talking to parents about their journeys in parenting a child with a disability. We began by conducting extensive interviews with 15 parents whose children have a variety of conditions. As they narrated their journey from the initial diagnosis to the present, we asked them to share specific strategies they found effective for managing their personal and family lives. We then developed a survey instrument that we sent to two larger groups of parents. We asked them to indicate how important each of the strategies mentioned by the first group of parents had been to them as they parented their children. In particular, we were interested in documenting life management strategies that were deemed effective by the large majority of parents, regardless of child age and disability.

Parenting a child with a disability is an adventure. Each day brings about another challenge and another test that pushes the limits of ones ability to persevere. It is when these trials are overcome and the successes, no matter how small, are accumulated that entire families find the strength that they need to continue. These lives are truly inspiring.

We have collected information from more than 200 parents. They described how the diagnosis of disability catapulted them into a bewildering new world. They shared the things that both helped and hindered them along the way. And they spoke powerfully of how, through the years, they have developed new ways of thinking, new ways of feeling and a determination to stay the course.

After analyzing these stories, we were able to document a number of strategies that parents held in common. We call these the Top Twenty Strategies for Effective Life Management, and would like to share them with you through the words of parents.

"My advice to a parent of a child newly diagnosed is, first of all, just to celebrate the birth of this child. Just to enjoy this child…because everyone else will try to give him a label." [mother of a nine-year-old son with severe multiple disabilities]

Choose to focus on what's going right

"I dwell so much on the positive that you would think Ryan was actually pretty high functioning, [though] he's very, very limited in what he can do. But I don't look at those things. I think it's much easier to celebrate the little successes and sometimes they're minuscule. You have to look at the positives and the little successes and dwell on those." [mother of a nine-year-old son with autism]

Get beyond the "why?" to the "how?"

"If we could all just accept our kids and teach them they're pretty great just the way they are… the sooner you do it the better it is. Pretending like they're gonna get well later—oh, I went through that phase. It was always some miracle that was going to happen. But that's all dead time, all 'no growth' time for you and your child. So the sooner you can say, 'This is how it is. Let's go forward from here,' the better it is for everyone!" [mother of an adult son with profound hearing impairment]

Appreciate what your child contributes to others

"Last year one of Jana's friends wouldn't go to Brownie camp unless Jana went. This friend's mother phoned me, desperate, weeks before camp: 'Jana's not getting sick, is she? She's still going to go, isn't she? Because my daughter will not go without Jana.' And so we learned that Jana is a support to her friends, she does contribute. And those are the things we needed to start looking at." [mother of a nine-year-old daughter with Down syndrome]

Trust your instincts

"After two years [of preschool] I felt very frustrated. I used to leave there crying, thinking, 'Why are you letting them do that to him and treat him like that and talk to him like that?' But slowly I developed the confidence to decide I don't have to be this way any more! Now I think there's nothing that I couldn't do if I set my mind to it." [mother of a nine-year-old son with autism]

Don't go it alone; ask for help

"I needed to take my daughter to another city for treatment and we didn't have the money to pay for the airline tickets. I was moved to phone our minister—I'd never, ever asked for help from this church before, but I called and explained our situation. They were able to give us some financial help. And the minister phoned down to some families in that city and asked if someone could meet us. So a couple met us at the airport. They put their arms around us and kept them around us six whole weeks. And when we came home I realized that it wasn't Mandy who had had the healing, it was me. And it sort of turned my thinking around; I learned that you don't get help unless you ask for it. As long as people think you're okay, they leave you alone." [mother of a 17-year-old daughter with moderate developmental delay]

Reassess success

"You have to learn to come up with your own definition of what a successful child is, and not bow to the theory that the successful child is going to grow up, get married, have a good job and do this and that. You have to say, 'Well, for our child it will be different. For him success might be something else.' You have to throw out the old definitions. As long as he's happy at what he's doing, why should we define [what] happiness [is]?" [father of an eight-year-old son with pervasive developmental delay]

Utilize planned perseverance

"I spoke with a resource person and she said, 'Every year you're going to have to address the same issues: Who's going to be the teacher? What kind of support is there going to be and will that be sufficient for my child? Every year you're going to have to address this. Just put it on the calendar.'" [mother of a six-year-old son with an undiagnosed genetic condition]

Be a parent first

"There's one thing I'd do differently now. When we found out Jeremy was hearing-impaired, I signed up for a course, 'How to work with your hearing-impaired child.' And all of a sudden I turned into his teacher instead of his mother. But finally, a few years ago, I just woke up and said, 'I'm sorry. I'm not doing this. I'm not going to sit across from the table and force him to do this. I'm just going to practice being his mother.' And I'm much happier. I feel it was like a weight lifted off me." [mother of an 11-year-old son with cerebral palsy and profound hearing impairment]

Keep your sense of humor

"The stories about Nathan have become family tradition. Lots of families have stories that they tell and retell. But the Nathan stories in our family are the funniest—he's just hilarious. Oh, there have been lots of stressful times. For every funny story there are probably 10 or 20 difficult stories—stories of challenges and trials. But it's the funny stories that keep you going." [mother of an 11-year-old son with Down syndrome]

Be flexible day to day

"Because of her illness, how Laura feels fluctuates a great deal. So I wrote a list called White Days, Gray Days and Black Days. On 'white days' [the good days] I might go to the park, go out, cook dinner, make the most of a day when Laura's feeling well and has some energy. 'Gray days' [in-between days] I still put things on my list, like cook supper—but it's more like sit and watch a video with Laura, read books, or go to work, as she can still go to the babysitter on gray days. On 'black days' when she's really ill, we might order pizza or, if there are plans, change them." [mother of a seven-year-old daughter with degenerative metabolic disorder]

continued on page 32

continued from page 31

Give yourself a "time out"

"I have one night a week and it's mine. I need it. I always have something to look forward to and that's what gets me by. I forget about everything for an evening and go out with my girlfriends. I know none of them can relate to what I go through. They have stress and they have so-called 'normal' kids. If they need one night out a week, I probably need three. But, yes, I just go out and try not to worry about it that night, and somehow the next day it doesn't seem that bad." [mother of seven-year-old triplets with moderate to severe developmental disabilities]

Allow yourself "ups" and "downs"

"Even though I say I have accepted everything that has happened with Jason—yes, I have accepted it. But there are always times when I will hear a song on the radio and all of a sudden it will hit me, 'He's never going to hear that exactly like I do.' I will go through the grieving process again, and I will cry. And then away I go and I'm okay. I think this is just a life-long thing. He's going to be my baby even when I'm 80 years old. And I think it's okay to give yourself permission to keep feeling." [mother of an 11-year-old son with cerebral palsy and profound hearing impairment]

Remember to nurture your marriage

"Court your wife. You know she's going to be stressed out, and so will you, and you will need each other. Do what you need to find time to be with each other. Go to dinner—go to a movie—do whatever you want to. Find time when you can be away from the demands and just be together." [father of a 12-year-old-daughter with severe developmental delay]

Be a family

"As a parent, you have to set an expectation to make things happen. One thing we do is go to a lodge in the mountains. The whole family goes, and you think, 'Yes, we can still do things as a family.' And we've always insisted that we eat breakfast as a family. Sometimes our kids complain, but I think it's important to be together as a family." [mother of a nine-year-old son with severe multiple disabilities]

Balance time together with each of your children

"My son once said, 'You really do like Tommy much better than us, don't you?' I asked why, and he said, 'You're always spending time with him and you're always holding him.' Well, one thing an experience like this does to you is to make you think consciously about a lot of things you never thought about before, like spending time with your other children. And I guess it's not being afraid to talk to your kids about the situation, either." [mother of a nine-year-old son with multiple disabilities]

Know what you want and go for it

"I think the ability to problem-solve is very valuable. Don't take 'no' as a final answer; take it as a definite 'maybe' and go from there. A lot of times they say 'no' because they think you're going to go away. What you need to do is try to analyze the situation. If you do your homework, are well prepared, and make a legitimate argument, oftentimes people will listen." [mother of a 25-year-old son with Coffin-Lowry syndrome]

Be resourceful; find ways to be understood

"A neighbor came in one morning and we spent a morning taping Rachel in spasm, just to show the work that was involved in caring for her. We did it for the medical profession, because they couldn't understand my story. So I have it on video. I have shown it to social workers, too, and I think it would be a good tool for group homes so they can be prepared for the kind of help needed." [mother of a 17-year-old daughter with moderate developmental delay]

Connect with other parents

"I feel it is extremely important that parents of children with disabilities make contact with each other, because there's nothing like speaking with somebody who's in the same boat. There's something that draws us all together. If I'm having difficulty with something, I will not call the professionals. Other parents are the first people that I will call. I will ask another parent, 'Did you have to deal with this? How did you handle it?'" [mother of 11-year old son with cerebral palsy and profound hearing impairment]

Value the journey

"When I look back I realize my son has been a wonderful teacher to me. He's had an impact on so many lives—that's the wonderful part. When Chris was young I used to think I had to know [right now] everything he'd need to know. In time I learned that as Chris grows, I will grow. And I will have the knowledge needed to meet his challenges. It was very important for me to recognize that." [mother of a 15 year-old boy with Down syndrome]

These are twenty of the life-management strategies most often mentioned by parents in our studies. Every family that participated in our study was diverse, complex and unique, and each employed the strategies in a way that was unique to their family situation. It seems that there are many paths through the Land of Oz, and through working together parents can create useful roadmaps and identify familiar landmarks. EP

Kate Scorgie, Ph.D. is an Associate Professor of Graduate Education at Azusa Pacific University (California). Lorraine Wilgosh, PhD, is a Special Education professor in the Departmentof Educational Psychology at the University of Alberta.

Who will care for your disabled child when you are gone?

Litigators Incorporated, P.C. & Affiliated Law Firms

ATTORNEYS ACROSS THE NATION

Dear Parents:

My sister died leaving behind a disabled child. If you have a child with a disability, the obligation for his or her care continues even after you are gone. My name is Jeff Brody, President of Litigators Incorporated, P.C. Let us help you find out if your child's disability was preventable; you could be entitled to substantial compensation for the lifetime care of your child. You owe it to your child to protect their future. There are time limits, please call me

Check out my web-site at www.thelitigatorsinc.com

Litigators Incorporated, P.C. is an Illinois licensed corporation with affiliated law firms throughout the United States

KEYNOTE SPEAKERS AT WORLD CONGRESS & EXPOSITION ON DISABILITIES EDUCATE AND INSPIRE ATTENDEES

The Keynote Speakers at the World Congress & Exposition on Disabilities, that recently took place on October 3-5, offered attendees inspiring words, practical advice and hope for the future. Each keynote speaker addressed a room of over 1,000 people. The 3rd Annual WCD took place at the Orange County Convention Center in Orlando, Florida.

Opening the keynote series was Robert H. Pasternack, of the U.S. Department of Education, on Thursday, October 3rd at 10:00 a.m. Dr. Pasternack is the Assistant Secretary for Special Education and Rehabilitative Services and serves as principal advisor to the U.S. Secretary of Education on these matters. He also has a lifelong personal experience with people with disabilities, as the legal guardian for nearly 20 years for his brother, who was born with Down syndrome.

Dr. Pasternack's speech addressed "A New Era in Education—The No Child Left Behind Act." He opened his talk with a proclamation from President Bush that announced October as National Disability Employment Month. He said that it was a high priority of the current administration to insure that all citizens should be able to be employed and that disability does not mean "no" ability.

He told a filled room that if people with disabilities want to go to college, they should be able to go to college, and if they want to work they should be able to work. He also stressed that there were other quality of life issues that need to be addressed including lack of housing for the disabled and inadequate transportation. Dr. Pasternack also stressed the importance of technology and improved mental health services in the lives of the disabled.

He concluded with reaffirmation of his commitment to the No Child Left Behind Act and with helping the more than 50 million people in the U.S. with disabilities.

The Thursday afternoon keynote speaker was given by Jeff Taylor, Founder and Chairman of Monster. Mr. Taylor is recognized as an innovator and a visionary in both the Internet and career industries. Through Mr. Taylor's guidance and leadership, Monster catapulted to the number one position in the online career industry, currently serving over 10 million job seekers each month, and has reinvented the way in which the world looks for employment.

Underscoring the importance of October being "National Disability Employment Month,' Mr. Taylor spoke about the Internet's power to help people with disabilities find jobs and match specific skills with the appropriate employers.

On Friday morning, Francis S. Collins, M.D., Ph.D., a Physician-Geneticist for the National Human Genome Research Institute (NHGRI), part of the National Institutes of Health, delivered a keynote address on "Genomics, Disabilities & the Future." Dr. Collins oversees a complex multidisciplinary project aimed at mapping and sequencing the entire human DNA, and determining aspects of its function. This is considered one of the most important scientific projects of our time.

He said that there are no perfect genetic specimens and estimates that every person carries between 5-50 significant genetic flaws. His organization is committed to studying the genetic componentary of all diseases.

In concert with the 50th Anniversary of the discovery of DNA in 2003, Dr. Collins also anticipates the announcement of bold new research plans for genomics. He also spoke about fulfilling the promise of genomics for better health including medical genomics, functional genomics, comparative genomics and proteomics.

On Friday afternoon, WCD was honored to have Governor Jeb Bush deliver a special address. He reiterated his administrations commitment to ensuring that individuals with disabilities and their families have equal opportunity and access to a meaningful life and a government that serves as part of the solution. He spoke about his initiatives that are focused on community based programs, vocational rehabilitation, assistive technology and about making it easier to get disabled parking passes.

After his speech, Governor Bush spent time with members of the audience including people with disabilities and their family members. He posed for pictures, answered questions, signed autographs and was well received by all the attendees.

On the last day of the WCD event, Saturday, October 5th, General James L. Jones, 32nd Commandant of the Marine Corps presented the final Keynote Address. General Jones illustrious career has spanned over 35 years of serving his country including active duty in Vietnam, Japan, Northern Iraq, Turkey, Germany, Bosnia, and Macedonia. He was promoted to General on June 30, 1991 and assumed his current post on July 1, 1999. The General and his wife Diane Jones are members of the U.S. Armed Forces Exceptional Family Member Program. This program provides assistance to family members of service personnel who have special needs.

General Jones praised the WCD for "Joining One Good Act to Another," by providing hope and a good quality of life. He spoke about the efforts of the military to help people with disabilities and special needs to obtain medical, educational and employment opportunities. He also will continue his advocacy to make political leaders aware of the needs of people with disabilities. General Jones also felt that his work with the military community can transcend to all types of communities.

He concluded with his sincere hope that all the attendees at the WCD would profit from their experience at the event.

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

NCP
VNS
THERAPY
VAGUS NERVE STIMULATION
Cyberonics

BEST COPY AVAILABLE

VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

EXECUTIVE SUMMARY[1]
SAFETY INFORMATION
FOR THE NCP® SYSTEM

INTENDED USE / INDICATIONS – UNITED STATES

The NCP System is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications.

CONTRAINDICATIONS

- The NCP System cannot be used in patients after a bilateral or left cervical vagotomy.
- Do not use short-wave diathermy, microwave diathermy, or therapeutic ultrasound diathermy on patients implanted with the NCP System. Diagnostic ultrasound is not included in this contraindication.

WARNINGS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals. This is not intended to serve as a substitute for the complete NCP System Physician's Manual.

⚠ The **safety and efficacy** of the NCP System has not been established for uses not covered in the "Intended Use/ Indications" section of the manual.

⚠ The safety and efficacy of the NCP System treatment has not been established for stimulation of the **right vagus nerve** or of any other nerve, muscle, or tissue.

⚠ **Excessive stimulation** at a combination of high frequency (≥ 50 Hz) and an excess duty cycle (that is, one that occurs when ON time is greater than OFF time) has resulted in degenerative nerve damage in laboratory animals. An excess duty cycle can be produced by continuous or frequent magnet activation (> 8 hours), as determined by animal studies. Cyberonics recommends against stimulation at these combinations of ranges.

⚠ **Aspiration** may result from the increased swallowing difficulties reported by some patients during stimulation. Patients who have **pre-existing swallowing difficulties** are at greater risk for aspiration.

⚠ **Device malfunction** could cause painful stimulation or direct current stimulation. Either event could cause nerve damage and other associated problems. Patients should be instructed to use the magnet to stop stimulation if they suspect a malfunction, and then to contact their physician immediately for further evaluation. Prompt surgical intervention may be required if a malfunction occurs.

⚠ Susceptible patients with predisposed cardiac conduction systems (re-entry pathway) have not been studied as part of controlled clinical trials to establish the safety of NCP system treatment in these patients. Evaluation by a cardiologist is recommended if the family history, patient history, or electrocardiogram suggests an abnormal cardiac conduction pathway. Serum electrolytes, magnesium, and calcium should be documented before implantation. Post-implant electrocardiograms and Holter monitoring are recommended if clinically indicated.

⚠ **Sudden unexplained death in epilepsy (SUDEP)**: Through August 1996, 10 sudden and unexplained deaths (definite, probable, and possible) were recorded among the 1,000 patients implanted and treated with the NCP device. During this period, these patients had accumulated 2,017 patient-years of exposure. Some of these deaths could represent seizure-related deaths in which the seizure was not observed, at night, for example. This number represents an incidence of 5.0 definite, probable, and possible SUDEP deaths per 1,000 patient-years. Although this rate exceeds that expected in a healthy (nonepileptic) population matched for age and sex, it is within the range of estimates for epilepsy patients not receiving vagus nerve stimulation, ranging from 1.3 SUDEP deaths for the general population of patients with epilepsy, to 3.5 (for definite and probable) for a recently studied antiepileptic drug (AED) clinical trial population similar to the NCP System clinical cohort, to 9.3 for patients with partial onset epilepsy.

⚠ **The NCP device is not curative:** Physicians should warn patients that the NCP System is not a cure for epilepsy and that since seizures may occur unexpectedly, patients should consult with a physician before engaging in un-supervised activities, such as driving, swimming, and bathing, and in strenuous sports that could harm them or others.

⚠ **Obstructive Sleep Apnea:** Patients with obstructive sleep apnea (OSA) may have increased apneic events during stimulation. Cyberonics recommends care when treating patients with preexisting OSA. Lowering stimulus frequency or prolonging OFF time may prevent exacerbation of OSA.

PRECAUTIONS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals.

⚠ **Laryngeal irritation** may result from stimulation. **Patients who smoke** may have an increased risk of laryngeal irritation.

⚠ **Dyspnea** may result from stimulation. **Patients with chronic obstructive pulmonary disease** may have an increased risk of dyspnea.

⚠ It is important to follow **recommended implantation procedures and intraoperative product testing** described in this manual. During the intraoperative Lead Test, rare incidents of bradycardia and/or asystole have occurred. As of October 1998, approximately 3,000 patients had been implanted with the NCP System. Four of these patients were reported to have experienced **bradycardia and/or asystole** during the intraoperative Lead Test. All four patients recovered without sequelae. One of the four patients was implanted with the NCP System. There were no postoperative or VNS-treatment-related cardiac adverse events later reported for that patient. No similar events were reported to have occurred during the clinical studies at the time of implantation or during treatment. The safety of this therapy has not been systematically established for patients experiencing bradycardia or asystole during NCP System implantation.

⚠ **Reversal of lead polarity has been associated with an increased chance of bradycardia** in animal studies. It is important to make sure that the Lead connector pins a correctly inserted (white marker to + connection) into the Pulse Generator header.

⚠ It is important to follow **infection control procedures**. Infections related to any implanted device are difficult to treat and may require that the device be explanted. Cyberonics recommends that the patient be given antibiotics preoperatively. The surgeon should ensu that all instruments, including the NCP Tunneling Tool, are sterile prior to the operation.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve** in the neck area inside the carotid sheath.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve below wher the superior and inferior cervical cardiac branches separate from the vagus nerve**.

⚠ **A neck brace** can be used by the patient for the first week to help ensure proper Bipolar Lead stabilization.

Environmental and Medical Therapy Hazards

⚠ Patients should exercise reasonable caution in avoiding devices that generate a **strong electric or magnetic field**. (For examples, see the "Other Environmental Hazards" sectio of the Physician's Manual.) If a Pulse Generator ceases operation while in the presence of electromagnetic interference (EMI), moving away from the source may allow it to return to its normal mode of operation.

⚠ NCP System operation **should always be checked** by performing device diagnostics afte any of the procedures mentioned in the Physician's Manual.

⚠ Because of where the Pulse Generator is implanted in the chest, **patients may need to b specially positioned in mammography equipment for clear imaging**. Otherwise, the device may be seen as a shadow on the mammogram. (Most routine diagnostic procedure such as fluoroscopy and x-radiography, are not expected to affect system operation.)

⚠ **Therapeutic radiation** may damage the Pulse Generator's circuitry, although no testing h been done to date and no definite information on radiation effects is available. Sources of such radiation include therapeutic x-rays, cobalt machines, and linear accelerators. The radiation effect is cumulative, with the total dosage determining the extent of damage. The effects of exposure to such radiation can range from a temporary disturbance to permanen damage, and may not be detectable immediately.

⚠ **External defibrillation** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for external defibrillation.

⚠ **Electrocautery surgery** may damage the Pulse Generator. Please refer to the Physician Manual for complete instructions for electrocautery surgery.

⚠ **Magnetic resonance imaging** (MRI) should not be performed with a magnetic resonance body coil in the transmit mode. The heat induced in the Bipolar Lead by an MRI body scan can cause injury.

Use caution when other MRI systems are used, since adverse events may occur because different magnetic field distributions.

⚠ No scan in which the radiofrequency (RF) is transmitted by the body coil should be done o a patient who has the NCP System. Thus, protocols must not be used which utilize local coils that are RF-receive only, with RF-transmit performed by the body coil. Note that som RF head coils are receive only, and that most other local coils, such as knee and spinal coils, are also RF-receive only. **These coils must not be used in patients with the NCP System.**

⚠ **Therapeutic ultrasound.** Routine therapeutic ultrasound could damage the Pulse Generator and may be inadvertently concentrated by the device, causing harm to the patient.

⚠ **Extracorporeal shockwave lithotripsy** may damage the Pulse Generator. If therapeutic ultrasound therapy is required, avoid positioning the Pulse Generator part of the body in th water bath or in any other position that would expose it to ultrasound therapy. If that positioning cannot be avoided, program the Pulse Generator output to 0 mA for the treatment, and then after therapy, reprogram the Pulse Generator to the original parameters.

Diagnostic ultrasound is not expected to affect the NCP System.

⚠ The Pulse Generator may affect the operation of **other implanted devices,** such as cardi pacemakers and implantable defibrillators. Possible effects include sensing problems and inappropriate Pulse Generator responses. If the Pulse Generator patient requires concurrent implantable pacemaker and/or defibrillator therapy, careful programming of ea system is necessary to optimize the patient's benefit from each device.

ADVERSE EVENTS

Adverse events reported during clinical studies as statistically significant are listed in alphabetical order Ataxia (muscle movements or twitching, generally associated with stimulation); Dyspepsia (indigestion); Dyspnea (difficulty breathing, shortness of breath); Hypesthesia (impaired sense of touch); Increased coughing; Infection; Insomnia (inability to sleep); Laryngismus (throat, larnx spasms); Nausea; Pain; Paresthesia (prickling of the skin); Pharyngitis (inflammation of the pharn throat); Voice alteration (hoarseness),Vomiting.

Other potential adverse events possibly associated with surgery or stimulation include but are limited to the following:

Aspiration (fluid in the lungs); Blood clotting; Choking sensation; Damage to nerves or vasculature the surgical area, including the carotid artery and jugular vein; Device (Generator and/or Lead) migration or extrusion; Dizziness; Dysphagia (difficulty swallowing); Duodenal ulcer, gastric ulcer; Ear pain; Facial flushing; Facial paralysis, paresis; Foreign body reaction to implants, including possible tumor formation; Formation of fibrous tissue, pockets of fluid; Heart rate and rhythm changes; Hiccuping; Incision site pain; Irritability; Laryngeal irritation (sore, painful throat); Left hemidiaphragm paralysis; Left recurrent laryngeal nerve injury; Left vocal cord paralysis; Low-grad fever; Muscle pain; Neck pain; Nerve injury; Painful or irregular stimulation; Skin, tissue reaction; Stomach discomfort; Tinnitus (ringing in the ears); Tooth pain; Unusual scarring at the incision sit Urinary retention; Vagus nerve paralysis; Weight change; Worsening of asthma and bronchitis; Worsening of cardiac abnormalities, including heart rate and rhythm.

⚠ Patients who manipulate the Pulse Generator and Bipolar Lead through the skin may dama or disconnect the Bipolar Lead from the Pulse Generator and/or possibly cause damage to vagus nerve.

---

The information is not intended to serve as a substitute for a complete and through understanding of the material presented in all of the Physician Manuals for the NCP System and its component parts nor does this information represent full disclosure of all pertinent information concerning the use of this product, potential safety complications, or efficacy outcomes.

Exceptional Parents and the Exceptional Stress of the Holidays

—**Excerpted and modified from Lisa Groen Braner's *The Mother's Book of Well-Being***

AVAILABLE AT THE EP LIBRARY WWW.EPLIBRARY.COM

How many years did you walk through a shopping mall during the holidays, hurrying past the long line of parents and children waiting to sit on Santa's lap? You might have held your breath as you burrowed through crowds, determined to make it to as many stores as possible. Maybe you saw the lighted snowflakes hanging from the ceilings. Listened to the student choir serenading you with carols full of hope, goodwill and peace…

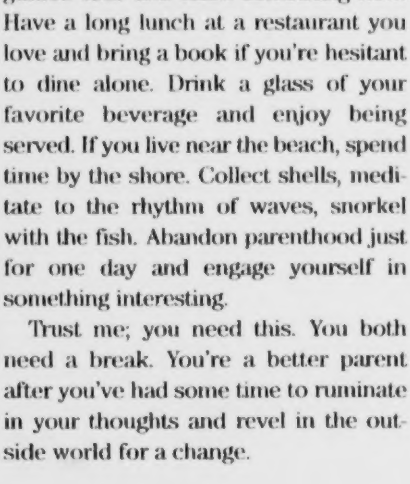
For my son's first Christmas, I stood in Santa's line with many other new mothers and fathers, our babies tucked in arms or strollers. Life-sized red and green candy canes flanked the entrance to Santa's den. Parents peered around winter coats and shopping bags, eagerly trying to catch a peek of the white bearded man dressed in red velvet. The elves and Mrs. Claus worked the crowd, cooing at babies and handing out peppermint sticks and order forms. It's possible that we were the most cheerful adults in the mall, as though we were meeting Santa for the first time. Then suddenly, as if led by the Ghost of Christmas Past, I saw my old self stride past me. She sighed, checked her watch a couple times, and darted into a store and out of my view. She didn't bother looking our way. Her hurried pace and fixed gaze made me realize how much my son had opened my eyes again to life.

What was your first Holiday season as an Exceptional Parent like? Perhaps you found yourself in the Santa line, remembering your own childhood. Holidays are a time to cherish our children and to reflect on the challenges both our children and us must face in this world. Not only is it essential for you to take time to give to your children, don't forget to take time for yourself and your spouse.

The Holiday season is a great time for you to schedule a day off for yourself. I'm referring to the whole day, not two hours in a shopping mall. Imagine what you would do with a whole day off. Take some time to think about it; the ideas will come to you quickly.

Hiking in a state park might fit the bill, staring up at the sky through limbs and leaves. If weather doesn't permit, visit your favorite museum. Pay for a guided tour and learn something new. Have a long lunch at a restaurant you love and bring a book if you're hesitant to dine alone. Drink a glass of your favorite beverage and enjoy being served. If you live near the beach, spend time by the shore. Collect shells, meditate to the rhythm of waves, snorkel with the fish. Abandon parenthood just for one day and engage yourself in something interesting.

Trust me; you need this. You both need a break. You're a better parent after you've had some time to ruminate in your thoughts and revel in the outside world for a change.



For my first whole day away from motherhood, I drove to the city for a morning of art and an afternoon of "high tea." While browsing Picasso's lesser-known drawings, I listened to a string quartet that formed unexpectedly in the museum's lobby. At tea, I nibbled cucumber sandwiches and miniature French pastries. I sipped English Breakfast tea from china and relaxed into an armchair covered in tapestry. My day felt extravagant and cushy. My first holiday from motherhood made a lasting impression; now when the days and weeks overpower my patience and stamina, I make plans for another.

"Having a baby is living in the eternal now. Having a baby means caring intensely about the stage you're going through, while forgetting everything that happened more than a week ago," says mother and writer Alisa Kwitney about the timelessness and novelty of maternal life in her essay "The Eternal Now." Children reawaken our senses, allowing us to share their joy in experiencing a single moment. So many moments call to us if we will only listen. May this holiday season rekindle your awareness of the simple pleasures in life as well as provide you with hope and strength for the coming year. EP

Self-Regulation and STRESS Management

Carolyn G. Cantu, MS, OTR

Imagine stress levels rising as your child experiences a "behavior meltdown" at the supermarket's check-out counter. Imagine the apprehension developing in your classroom as a particular child once again unsettles your class with disruptive behavior. Children with underdeveloped self-regulation repeatedly exhibit unruly behavior. Stress levels often increase in them, their families, teachers and classmates. Teaching the child to regulate his or her own nervous system decreases stress and promotes an overall sense of calm.

Stress experienced by parents, caregivers, therapists and teachers who live or work with an exceptional child is a common phenomenon. If adults feel stressed, think of the tension children feel when their minds and bodies are experiencing ongoing agitation. Recently, an adult interviewed on a television broadcast about ADHD described her childhood as "listening to ten radios being played in my head at the same time." This is a clear example of the internal sensations some children experience throughout each day. Sometimes

continued on page 42

continued from page 41

every calming technique tried is of no avail, causing stress to spiral upward for children and their caregiving adults.

Figures relating specifically to children with self-regulation problems are difficult to obtain. We do know, however, that recent statistics show three to five percent of all school age children are diagnosed with ADHD. Representing only one diagnostic category, that statistic alone presents a snapshot of the impact disruptive behavior has on households and classrooms.

Without self-regulation as a component of overall intervention it is possible for these behaviors to intensify, causing stress to escalate and remain at an elevated level.

Which are those conditions connecting stress to behavior patterns?

Children experiencing ADD, ADHD, Down syndrome, developmental delays, sensory processing dysfunction, learning disabilities, social stress and/or crisis situations share some characteristics. Disruptive behavior, clinging to adults, intrusion into others' space, inappropriately loud voices, difficulty with transitions and occasional tantrums are common behaviors reported by parents and teachers. Without self-regulation as a component of overall intervention it is possible for these behaviors to intensify, causing stress to escalate and remain at an elevated level.

If any of us as parents, teachers or therapists are experiencing this connection with special needs children, we might benefit from a closer look at what is defined as self-regulation and how it reduces stress in those under our care.

Definitions and Approaches

Self-regulation is addressed by a variety of health and educational disciplines. Professionals define and approach stress reduction from their respective frames of reference. For example, pediatricians focus on the physiological effects of stress on the child and family, pediatric occupational therapists from sensory processing and sensory organization models, educational psychologists and researchers from the cognitive component and child psychologists from the emotional/social component.

As defined by Mary Sue Williams, OTR/L and Sherry Shellenberger, OTR/L, "Self regulation is the ability to attain, maintain and change arousal (alertness) appropriately for a task or situation The child's behavior may reflect both the current level of organization of the nervous system and his best attempt to respond adaptively and efficiently to the demands of a situation or task" (http://www.alertprogram.com).

Occupational therapy's sensory integration approach to self-regulation

Children experiencing regulatory problems frequently exhibit sensory defensiveness to external stimuli, demonstrate resistance to calming efforts and demonstrate difficulty with eating and sleeping schedules. Under the guidance of A. Jean Ayres, PhD, OTR, occupational therapists have, since the 1960s, used varied tactile and movement input to desensitize or regulate some of the disorganization that these children were experiencing. Therapists soon noted that follow-through at home and school became an issue. How were therapists able to have sensory input reinforced and followed through at home without putting more of a burden on parents and teachers?

In 1994 and again in 1996, Williams and Shellenberger published a workbook offering therapeutic strategies to develop children's "alert systems," leading toward self-regulation. Alert systems may be thought of as sensitivity to arousal states, both controlled and uncontrolled. Their Alert Program addresses self-calming/self-regulating from this sensory awareness perspective. Building upon neurological development and the body's sensory system as a foundation, Williams and Shellenberger devised a cleverly effective program enabling parents, teachers and children to become aware of individual levels of alertness or arousal states. "Is your engine running high, low or just right?" becomes a standard question children learn to answer. They are then taught to adjust their alert levels to be appropriate to the activity or situation experienced at the moment. Using the central nervous system's seven sensory processes, the program teaches "how to recognize arousal (alert) states as they relate to attention, learning and behavior." The program follows through by offering children a variety of self-regulation strategies and activities they can use independently at home, school or in the community. Self-control increases—stress decreases.

A Cognitive/ Behavioral Approach:

The Early Education Clearinghouse, Boston, MA (http://www. factsinaction.org), notes that: "Self-regulation includes a child's ability to control his or her thoughts, responses and actions. Evidence suggests that the ability to self regulate during the early years of life is related to self-control in later childhood and throughout life. It also appears to contribute to social skills and school success."

This approach takes place at a higher level in the brain than the sensory approach. The child must stop, develop a cognitive awareness of the ineffective behavior, select a learned alternative behavior and follow through. In his book "Development and Self Direction," Professor Rafael Diaz focuses on school preparation. He states, "as a child's self direction/self regulation increases, the adult's direction may gradually be withdrawn, allowing the child to 'take over.'" Dr. Diaz identifies

Worth the work

Autism doesn't diminish Jack's need to assert his independence, but it does create some obstacles. At Heartspring we provide him with a picture schedule in the home and classroom settings to give each day a predictable structure. It's working remarkably well for everyone involved; Jack gets to enjoy an enhanced sense of self-worth ... we get to see that great smile.

continued from page 43

this concept as "developmentally appropriate practice" and defines self-direction as " the child's ability to plan, guide and monitor his/her own behavior flexibly and from within to change circumstances. By teaching self-direction the adult is teaching autonomy." Dr. Diaz points out the difference between self-direction and self-control. He defines self-direction as the ability to take direction from the adult within the adult's presence; and self-control as the ability to act according to the dictates of the caregivers in the absence of the caregiver.

The concept of gradually reducing structure and instruction as the child gains self control and discipline is appropriately applied to children experiencing behavioral difficulties.

Behavior modification techniques are also in the category of helping children control their responses. Acceptable behavior is repeatedly rewarded at home and school, as parents and teachers carry out a cooperative effort. These rewards occur in close succession, perhaps as frequently as every five to 15 minutes for the first week or two. Intensity of the program continues until the child is conditioned to extend the acceptable behavior for longer and longer periods of time. After four to six weeks there is generally a marked difference in the child's responses to interaction with others, changes in time, place, person or activity and ability to handle conflicting situations. Unacceptable, disruptive behavior is replaced by acceptable, effective behavior. Positive behavior reduces stress.

By developing sensitivity to those disturbing triggers, parents and teachers can divert children from situations that usually escalate.

Equally important is the development of self-regulation on an emotional/social level. A child's appropriate interaction with family, teachers and peers reduces stress for all those involved with the child. Dr. Gabor Maté's book Scattered outlines the difficulties some children experience in responding appropriately to social cues. These are the children who intrude into others' space and have a difficult time understanding why adults and peers avoid them or become upset with them, stress levels increase and confrontation occurs. Social self-regulation techniques need to be taught by parents and teachers so that these social intrusions do not become a constant cause of stress in the family or with peers.

Dr. Maté emphasizes the use of adult modeling. Because adult behavior makes such a lasting impression, children will imitate and eventually adopt the adult's self-regulatory behavior as their own. This strategy, along with acceptance regardless of behavior, builds the child's self-acceptance. Dr. Maté logically concludes that an "increase in self-acceptance decreases the need to demand it from others"—another positive effect of developing self-regulation. When the demand from others decreases, stress decreases (http://www.scatteredminds.com).

Yet another internationally known expert addresses the emotional/social aspect of self regulation and stress. Bruce D. Perry, MD, PhD, writes about stress response systems and self-regulation on the web site www.scholastic.com. He states, "As we mature, our brain requires that we actively participate in regulation....When a child's capacity for self-regulation does not develop normally, he is at risk for problems from tantrums to impulsiveness to difficulty regulating his own sleep and diet."

Dr. Perry reinforces understanding of self-regulation by acknowledging the importance of recognizing a poorly-organized nervous system. He addresses the concept of poor organization from a medical/psychological standpoint: "Many children have difficulty with self-regulation because their stress response systems are poorly organized and hyperactive."

From modeling self-control to seeking professional assistance early, he presents aids on his website (http://teacher.scholastic.com/professional/bruceperry) for parents and teachers to include in their daily routine. These strategies assist parents and teachers to significantly diminish stress.

With the help of pediatric occupational therapists, sensitize the child to his or her own arousal or alert states. Observe what triggers escalation. As Williams and Shellenburger ask, "Is your engine running on low, high or just right?." Incorporate those activities and techniques that the thera-

Combine two separate methods to defuse the potential explosion: (1) give the child a cracker to munch, providing sensory input in joints and muscles of the face and mouth; and (2) sidestep the tantrum by talking out.

pists suggest into your family routine and household schedule.

Help children manage emotions before provocation leads to aggression. By developing sensitivity to those disturbing triggers, parents and teachers can divert children from situations that usually escalate. Talk out the situation with the child and suggest an alternative in handling the disturbance.

To return to the supermarket: store tantrums usually occur when a child has had too much visual, auditory and tactile stimulation. The overload often occurs right at the check-out counter. Combine two separate methods to defuse the potential explosion: (1) give the child a cracker to munch, providing sensory input in joints and muscles of the face and mouth; and (2) sidestep the tantrum by talking out. "Joey has the box of animal crackers and you want the box; let's all take crackers in our hands and leave the box in the cart." Decreasing the aggressiveness by talking out the immediate situation tends to ward off the tantrum.

Duplicate the structure and repetition experienced in the clinic or special education classroom. This reinforces efforts of therapists and teachers and promotes composure and calm at home. Ask the therapist and teacher for home strategies that reinforce self-calming methods used in the clinic or classroom.

Attend community or university workshops presented by psychologists or special education teachers. Look for those concentrating on behavior modifica-

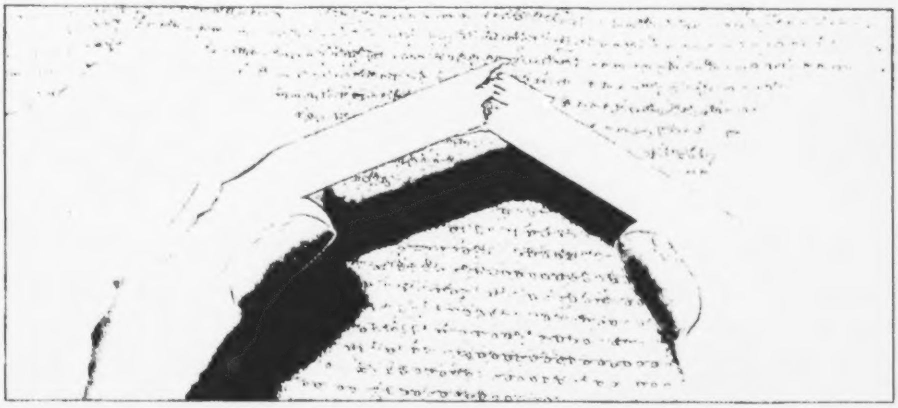
tion or self- regulation strategies easily applied at home.

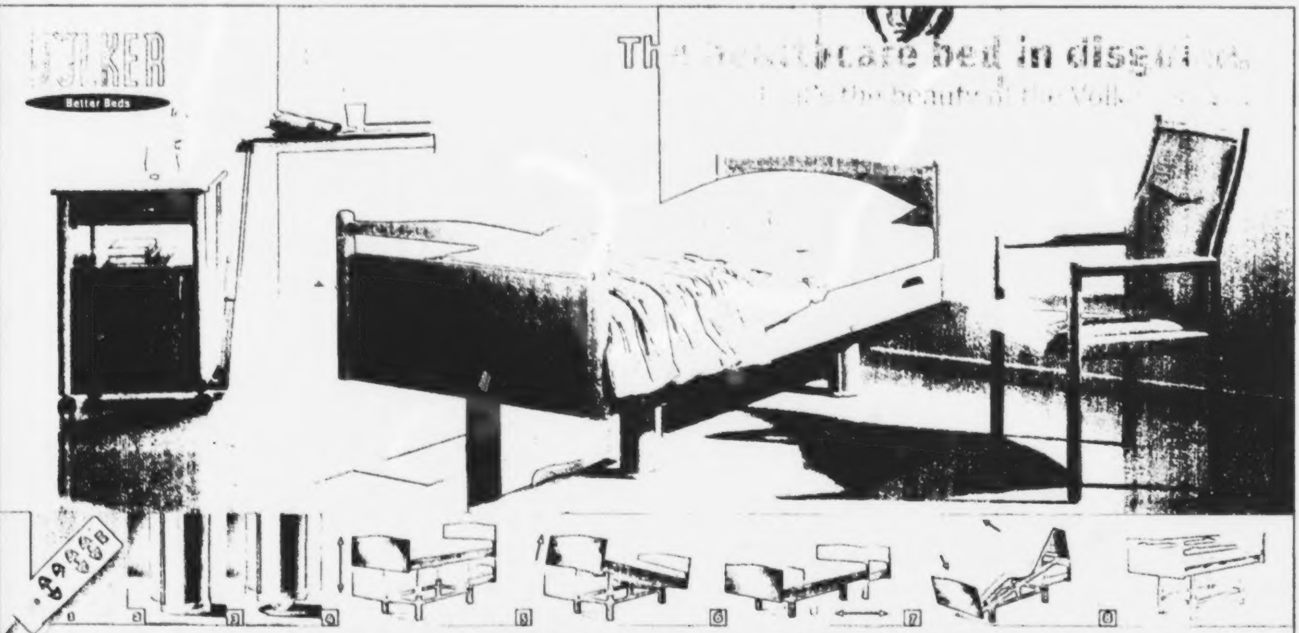


Conclusion

Physicians, pediatric occupational therapists, child psychologists and educational researchers agree that by increasing the child's self-regulatory ability, stress decreases for both child and parent. Added benefits include a rise in the level of the child's self-discipline, self-esteem and self-confidence. Whether the program of choice is based on sensory processing, alert system awareness, cognitive techniques or emotional/social intervention, self-regulation reduces burdensome stress in some exceptional children, their families and teachers. The important thing to remember is that no one program is a panacea for stress management. Integrating the best strategies from varied approaches to self-regulation has the best chance for success with stress release. EP

Carolyn O. Cantu, MS, OTR, is a licensed pediatric occupational therapist and educator who has practiced and taught all over the world for 32 years.

Most recently, she was a pediatric therapist and clinical educator for the Infant Parent Program, Austin, TX.



1. Electric operation via a hand control or nurse console (optional). 2. Absolutely secure braking. 3. Electric push button casters. 4. Stable height adjustment 15 1/2–31 1/2" (13 3/4–27 1/2" optional). 5. Trendelenberg/reverse Trendelenberg (optional). 6. Easy to move on disappearing casters. 7. Tilt-in-space positioning that allows for sitting (cardiac) or reclining chair. 8. Disappearing full lenght side rails.

8 Tips for a Stress Free Holiday Season

Enjoy More by Doing Less

This holiday season demands weeks of preparation—buying gifts, mailing cards, planning parties. Author Christine Klein (The Simpler Family, Robin Lane Press 2001) offers some advice to relieve the stress and regain the spirit of the season when the holidays become too hectic to enjoy.

Plan the celebration that YOU want, not the one the others expect it to be. Ask yourself this question: "If our family could spend the holidays the way WE want, how would it be different?" If it's too late to alter the course for this year's celebration, it's a good time to drop hints about your new plans for next year.

1

Lower your expectations. If you expect perfection, you will surely be disappointed. The kids will be restless at church. At least one toy won't work. One or more of your relatives will be irritating. And your house will not look like Martha Stewart's. Plan on it.

2

Skip the cards. If the holidays are too hectic to send cards, send Happy New Year or Valentine or St. Patrick's Day greetings instead. You'll have more time to prepare them and your recipients will have more time to appreciate them during the less-hectic time of year.

3

Keep the decorations simple. Hang a wreath on the door and position a spotlight nearby. Or place an electric candle in every window. Sometimes the simplest decorations can be the most attractive.

4

Let the children do the decorating. Somehow a tree that is slightly off-kilter with ornaments hung only as high as a child's hand can reach is more perfect than a tree decorated by adults.

5

Ask your guests to help. A potluck holiday meal is easier on the hostess (who must also clean the house), and gives everyone an opportunity to show off their best dish.

6

Begin your own family rituals that add quiet meaning to the holiday. Sprinkle birdseed outdoors just before bed so the birds wake-up to a happy surprise. Deliver homemade cookies to a homeless shelter. Make time for someone who's lonely.

7

Simplify gift-giving. Suggest to family members that gifts be given only to children. Or institute an exchange of names so you'll buy for only one adult or child instead of everyone.

8

Avoid the mall and give gifts from the heart. A written note of love is a greater treasure than a store-bought gift. "Five reasons why I think you're a great _____" is an ideal gift from student to teacher, child to parent or grandparent, or anyone special in your life.

Buy simple gifts: A favorite book, tickets to the zoo, a monthly car wash, dinner during the slower winter months. EP

Christine Klein is a graduate of Bowling Green University with a Bachelor of Science in Journalism. She left a successful marketing career to pursue her dream of living her life on her own terms, by working less and spending more time with her husband and two children. Her book, The Simpler Family, is the product of the strategy she created to accomplish that. Now a marketing consultant and freelance writer with plenty of time for her family and herself, she lives in Cincinnati, Ohio.

The Story OF A Pediatrician/ Parent

By Jo Feingold, MD

This article is the first of a two part story that chronicles a mother's—and a pediatricians—journey from early treatment and initial opposition to HBOT and then to her "conversion" to the therapy.

Tonight for the first time in years I sat and ate by myself. I don't mean I ate alone; I mean it was the first time in several years I didn't have to feed someone. My name is Jo Feingold and I am a physician—a pediatrician. My fervent hope is that by sharing my experiences as the mother of five children, including a set of triplets, it will help dispel the myth that all doctors are insensitive to parents of special-needs children and reinforce the need for more openness on the part of my profession—medicine—to alternative therapies for people with disabilities.

David Feingold and his daughter, Elisa

A Story About Family:

The "someone" I did not have to feed is my daughter Elisa. I have been blessed with five children. My seven-year-old is Daniela; Elisa is six and the triplets, Jonathan, Michael, and Jackie, are five. Every night we sit around the dinner table and discuss who will sit next to whom. Each one of my children "calls " for me to sit next to him or her. This could be an easy choice every night because, in theory, I could sit between any two of them. However, this is not possible, because Elisa has cerebral palsy. She needs me to sit next to her every night. She is more comfortable with me. My other children seem to understand and so they take turns at sitting next to me.

Tonight Daniela intervened on her brothers' behalf. Both cried to sit next to me. I attempted to cajole one of them to sit across from me, but it was useless. Daniela then told me to sit in between the boys and she would feed Elisa. This may seem like an insignificant gesture on the part of a small child, but it really is a sign of incredible maturity, sensitivity and caring. As a mother and health care professional, I am faced with the reality that I have a daughter with special needs who may never really achieve independence. I am also faced with the reality that neither I nor my husband will be able to take care of her forever. I see how the other children react. Their willingness to step up to the plate in taking care of their sister moves me. Tonight it was Danny's turn. Two days ago, as I was carrying Elisa to the bathroom, Jonathan told me that one day soon he would do that "because he's getting bigger." Their compassion and sensitivity fill me with a sense of emotion I have difficulty expressing in words. It is in precious moments such as these, when the reality of the whole situation sets in, that makes my heart fill with pride and love.

Parent Thoughts and Dreams

I became a mother and fully accepted the responsibility of my five miracles. Like any other mother, I have an incredible desire to protect, nurture, love and teach my children. The hardest part of being a parent is the knowledge that I will one day have to let go, and the nagging fear that that day may never arrive for one of my children. I have sat and pondered what would make me happy as a mother; what do I really want for these children? Do I want them to be physicians,

continued on page 52

continued from page 51

lawyers, scientists, mothers, fathers? My answer is always the same: I want them to be happy. I want them to be good people. I want them to understand and appreciate the precious gift of life and that all people are not created equal; so we are, all of us, responsible to help those who cannot help themselves. I want them to grow up to be people who will find it in their hearts to reach out and feed someone who is hungry, and to have the dignity to carry themselves with poise and strength. I want them to be able to be awed by a sunset, to understand that faith is important, to take strength in the knowledge that they always have each other. I would like each of them to be independent. All five of my children have the capacity of achieving their goals, including Elisa.

Elisa

Writing about Elisa is very painful. I cry almost every time I tell her story and I relive that story every day. It seems like her birth was light years away, yet at times it feels like it was only yesterday. June 13, 1996 was a day which changed my life. This was the day of the anniversary of my father's death. Thirty-five years had passed but the anniversary of his death is still a gloomy day. My mother was staying with me because I had some complications arising from my pregnancy. I was 31 weeks pregnant. I needed someone to take care of my toddler. I wanted to take my mother to church but for some reason she didn't want to leave. She told me she felt she had to be with me and she would pray for my father at home.

In the early afternoon I suddenly began to have vaginal bleeding. Although my doctor was far away, I called him. I remained very calm. I took my pulse and called 911. I told EMS that I was a physician, gave them my vital signs and remained calm. The bleeding continued while I stayed on the phone with EMS. I repeated my pulse. I was still calm. I had two large-bore IV's placed. I was still calm. I was taken to the nearest hospital by ambulance. My mother followed in the police car with Daniela. I remember the delivery room. All the doctors reassured me, but I was feeling weaker by the minute. As they closed the door I looked back to see my mother's face. She was in a panic. She had lost my father on this very day. Was she about to lose a daughter, and possibly a grandchild? Fear—the fear that strikes to the core—began to set in. I felt weaker. My mental status was changing. I remember saying "you're losing me." There were shouts: "give fluids," "call neonatology," "get that baby out." I cried to my father to help me.

The News

Elisa was born. She weighed four pounds, 11 ounces. I thought how lucky I was because she wasn't really tiny. The next three weeks were joyful ones. Elisa made progress. Although I was weak, I found myself in the car every day. We taped her, we took lots of pictures, we fed her and bathed her. I was getting stronger. Finally she was big enough for us to bring her home. They just had to do some routine tests among them a repeat head ultrasound and she would be home. The morning I was supposed to pick her up I got a call from her neonatologist. His words were like a knife in my heart and my world came to a crashing halt. He told me that my daughter had PVL (periventricular leukomalacia). He asked me if I knew what that was. I remember asking him "are you for real?" I reminded him that I was a physician—a pediatrician. He then told me that my daughter could have learning disabilities or muscular problems but "not to worry because probably she would be normal." I could pick her up whenever I wanted.

I knew better. I collapsed. It felt as if life stopped. Things started moving as if in slow motion. I remember what I was wearing, the room I was in, the color of my nails, the tears streaming down my face. I asked for a repeat test, and the result was the same. I asked for a neurology consult. The neurologist came in and talked to the nurses for at least 30 minutes before he addressed me and my husband while, crying, I held my daughter in my arms. The news began to set in.

A Physician's Perspective—How Much I Didn't Know

I took Elisa out of that hospital and got another head ultrasound at New York University Medical Center (NYU). I trained there. I knew all the doctors there. I trusted them. They confirmed the diagnosis and I fell apart—again. I walked the halls of NYU where years before I had roamed as a resident in training. I knew everyone there. I wanted to cry and shout but needed a private place. I wanted to bury myself in the earth, just me and my daughter. I wanted to tell everyone and no one. I was hurting and wanted others to know that; at the same time I wanted to run away. I looked for the head nurse, whom I knew well. I thought maybe I could use her office to collapse. I asked someone to page her. When she finally came, she didn't recognize me. She told me that she had received a call from one of her nurses, who told her there was a distraught woman looking for her. I must have looked horrible; I knew and worked with all those nurses, but not one of them recognized me.

Elisa was three months old when I found out I was carrying triplets. I cried myself to sleep almost every night because I would not see her make any progress. I was terrified at the possibility that the triplets I was carrying would have the same condition. I was advised to do a selective reduction but could not bring myself to do it. We worried a lot, we cried a lot and prayed as we never prayed before. I was on complete bed rest for nine weeks in the hospital. I counted the weeks, the days, the hours. We went through the fear of pre-term labor almost every day. Finally the triplets were born and, by the grace of God, they were fine. Elisa now had an expanded set of siblings and I had my work cut out for me.

Therapies: First Do No Harm.
Treat Until Treatments Do Not Help

Elisa had aggressive therapy from the time she stopped being "borderline normal" at six months, but she didn't make much progress. Her therapists were wonderful. They loved her and were very good with us. I assumed that I was doing all the right things: physical therapy and occupational therapy, speech therapy, early intervention, hydrotherapy, etc. She still was not making any progress.

A distant relative called my house. He told my mother that he had had a stroke and that he got better with hyperbaric oxygen treatments. He saw some children there like my little girl and they were getting better. I was urged to try it. I thought to myself, "How absurd is this? I am a trained physician and I am getting medical advice from a construction worker." I was the physician, the one with all the knowledge; yet this construction worker was telling me about a therapy my colleagues scoffed at, as there simply was not any valid scientific basis for the treatment's use in people with CP. I thought he was crazy. He insisted so many times that I finally called a pediatric neurologist, who confirmed that hyperbaric oxygen therapy was some form of quackery. ■

... TO BE CONTINUED

In the December issue, Dr. Fiengold talks about Elisa's experience with HBOT and outlines why she herself is now an ardent proponent of HBOT.

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

Toys to Enhance Development in Brain Injured Children
by Richard A. Neubauer, M.D., Medical Director

Hyperbaric oxygen is capable of arousing dormant, idling brain cells that have suffered some form of damage, which is characteristic of all CP and brain injured children. The extent of this damage may be seen by functional brain imaging, and the results of any type of therapy, especially hyperbaric oxygenation, may be gauged by improvement in blood flow and metabolism as shown on repeat scans.

As new cells develop in little ones, or as dormant idling cells begin to fire electrically in older children, they need a sense of direction. To provide this, we recommend PT, OT, speech therapy, and at times acupuncture and appropriate counseling.

However, the role of educational, age-appropriate toys must not be overlooked. Toys should be chosen that will encourage developmental progress in the child. Building blocks, shape sorters and color matching games are among the various playthings that promote important fine motor and sensory skills. As children get older, certainly computers play a major role. Stereo players with motivational music tapes such as those from the Monroe Institute in Virginia* will also enhance development. Thus, when the parents of children with special needs look for toys, they should look for educational playthings that can be motivational aids in learning; entertaining items that will also play a beneficial role in their child's development.

Patient Persistence

Adele M. Gill

Patient Persistence

ON SALE NOW! This book celebrates the ability of people to overcome obstacles to achieve their goals. The author, Adele Gill, is a certified disability analyst, a Fellow of the American Board of Disability Analysts, and an advocate of inspirational and motivational self-help. Ms. Gill has divided the book into two sections, Hope and Courage. Both contain selections that deal with turning points in people's lives, times when they found strength, hope, and the courage to persevere in the face of adversity. This book offers help and hope to those who feel that their lives are out of control or that things have gotten so bad that there will never be a way to make them better. Through examples from the lives of real people, this volume demonstrates that there is always a way.

No Apologies for Ritalin

Vidya Bhushan Gupta, MD

NO APOLOGIES FOR RITALIN

ORDER NOW & SAVE! This book takes an in-depth look at attention deficit disorder/attention deficit hyperactivity disorder (ADD/ ADHD). Vidya Bhushan Gupta, MD, MPH, a Board-certified pediatrician and a Fellow of the American Academy of Pediatrics, is Director of Developmental-Behavior Pediatrics at Metropolitan Hospital Center, New York City. In his book, Dr. Gupta eloquently educates parents of children with ADD/ADHD about the disorder and available treatments, so that they can make informed choices for the care of their children. The first portion of the book describes what is medically known about ADD/ADHD, including causes and diagnostic methods; the second part outlines available treatment options, including Ritalin and other drugs, dietary changes, herbal therapy, and behavior modification. Dr. Gupta's purpose is to help parents of children with ADD/ADHD to stop blaming themselves for their child's disorder and to investigate and use appropriate therapies, including Ritalin and other medications when indicated, without guilt.

NEVER GIVE UP THE SEARCH TO FIND THE RIGHT PLACE...

"I was advised to settle for something less, but kept searching. When I visited Crotched Mountain there was a tangible difference in attitude– a professionalism, respect, and "can-do" attitude that set them apart. Standards are high and the approach genuine–they really care! I am very happy with Crotched Mountain and most importantly, so is my son Jared. He has grown enormously in many ways and is becoming the young man that I always thought he could become. It's a family's dream, come true!" *—Kathy Berns*

CONTINUING PROGRESS IN The Diagnosis of Autism

By Eric London, M.D.

This month's Autism Spotlight centers on the diagnosis of autism. This first article explores the overall landscape in diagnosis, principally as it involves patients at the far ends of the spectrum, i.e. acute or very mild. The following article examines the great strides made in the diagnosis of autism in the very young. In coming months, this 14-part series will attempt to explore all areas of autism including alternative approaches. Reader comments and discussion are encouraged at epedit@aol.com.

Parents of children with autism know what autism is. We recognize the signs and symptoms, and most of us can instantly spot another autistic child on the playground or at the supermarket.

But it was not long ago that autism was a difficult and often-missed diagnosis.

Autism is considered a spectrum disorder because symptoms and severity vary from individual to individual. Autism is different in each person with the disorder - no two cases are the same.

It remains a challenging diagnosis at the far ends of the spectrum, when a child is so affected by autism that he or she looks "merely" retarded, or when he or she is so high-functioning that, to many, the child appears "ADD" or "OCD" or "merely" eccentric, not autistic. Today many of these children continue to be misdiagnosed.

But for the wide range of children in the middle of the spectrum, the years of diagnostic

continued on page 56

This article was supported by an educational grant from Janssen Pharmaceutica, L.P.

1279

continued from page 55

research has paid off. The diagnosis of autism has now been standardized, and both the clinical and research criteria are quite reliable. "Reliable," in this sense, means that, using the same criteria, anyone with training will make the same diagnosis for the same child.

Symptoms

According to the Diagnostic and Statistical Manual (DSM-IV), issued by the American Psychiatric Association, the general symptoms for autistic disorder include:

- A total of six or more impairments in social interaction; communication; and restrictive or repetitive and stereotypical patterns of behavior, interests and activities.

- Delays or abnormal functioning in social interaction; language as a means for communication; or symbolic or imaginative play, with onset before age three.

- Symptoms that cannot be described as Rett Syndrome or Childhood Disintegrative Disorder.

WARNING SIGNS:
Most specialists agree that a child should be evaluated for autism immediately if he or she has:

- Not babbled or cooed by one year
- Not gestured, pointed or waved by one year
- Not spoken a single word by 16 months
- Not spoken a two-word phrase (on his or her own) by two years
- Experiences any loss of any language skills at any age.

OTHER CONCERNS:
Parents should talk to their healthcare provider about an autism evaluation if they notice their child:

- Does not respond to his or her name
- Cannot tell or describe what he or she wants
- Experience any language delays
- Does not follow directions at all
- Appears at times to have a hearing impairment
- Does not know how to play with toys
- Has poor eye contact
- Appears to be in his or her own world
- Does not smile socially
- Has odd movement patterns
- Has unusual attachment to toys or other objects
- Regularly lines up toys or other items

NATIONAL ALLIANCE
FOR AUTISM RESEARCH

Over the past few years, the National Alliance for Autism Research (NAAR) has made significant investments in a collaborative study designed to identify early signs of autism and whether early interventions can improve the quality of life for children with autism and their families.

Diagnostic consistency is critical because clinicians make autism diagnoses on the basis of symptoms, not causes. There is no blood test or diagnostic scan available for autism; the disorder can only be identified on the basis of observable signs and symptoms.

For autism, as for all of the psychiatric illnesses, these signs and symptoms are listed in a manual called DSM-IV (Diagnostic and Statistical Manual of Mental Disorders IV - see sidebar). If the child has the requisite number of symptoms, the diagnosis of "autism" (or, alternatively, "pervasive developmental disorder not otherwise specified") can be made. This approach is known as a "phenomenological diagnosis" because it is based upon the outward phenomenon that accompany the disorder.

In contrast, many more strictly "medical" diseases can be given an "etiologic diagnosis," meaning that the diagnosis is based on the causes of the illnesses instead of its symptoms.

Take strep throat. The symptoms of strep throat are the patient's report that his throat hurts, and, upon examination, a physician finds inflammation. But a number of different causes can produce an inflamed throat, and the diagnosis of strep is made only when the physician can document that a certain kind of organism-streptococcal baccilli-is present.

Once the bacteria is found, the physician prescribes an antibiotic; if the inflammation is due to a virus, antibiotics will not be effective. Treatment is based on cause, not symptom.

Obviously an etiologic diagnosis is superior to a phenomenologic one. Unfortunately, brain disorders have proved to be so complex that their causes, or etiologies, are still unknown.

So for now we have only a descriptive understanding of what an individual with autism is like: we can "name" the disorder, and describe its symptoms.

The causes of autism remain unknown and there exists no specific medical treatments or cures for autism.

continued from page 57

Children with an autism spectrum disorder usually begin to show clear, identifiable symptoms by the age of 18 months. Many parents and experts can usually detect symptoms before this time, however a formal diagnosis is typically made when the child exhibits a noticeable delay in developing language skills - normally between the ages of two and three.

Over the past few years, the National Alliance for Autism Research (NAAR) has made significant investments in a collaborative study designed to identify early signs of autism and whether early intervention can improve the quality of life for children with autism and their families. Researchers involved in the multi-site project, known as the Baby Sibs Study, are examining the infant siblings of children with autism to develop better diagnostic methods and, eventually, more targeted interventions for younger children.

But aside from common signs and symptoms, what do we know about autism in a more profound sense?

- What is the cause or causes of what we now call autism?

- When does it start?
- What has gone wrong or is going wrong presently?
- What parts of the body are affected? How does it progress?
- What will the outcome be?

All of these questions need answers. There are many areas of research currently underway to tackle these issues-including genetics, brain scanning, biochemistry, etc.-but probably at this point it is fair to say that none of these are more important than the direct evidence obtained from studying the actual brain tissue from affected individuals.

In recognition of this, NAAR, in collaboration with the M.I.N.D. Institute at the University of California at Davis and the Autism Society of America established in 1998 the Autism Tissue Program, which is an ambitious effort to increase the availability of urgently needed brain tissue for autism research. The Autism Tissue Program encourages families nationwide to enroll as organ donors so the brain tissue of individuals with autism and related family members can be used for research. This gift of tissue brings a tremendous acceleration in the progress of autism research.

Also, the ability to study brain tissue is vitally important to the development of effective treatments. Until research determines the "targets" for potential medications (in most cases the target will be a specific receptor on the surface of a brain cell), it will be impossible to undertake "rational drug development" (meaning drug development directed at a specific, known problem in the brain) for the autism spectrum disorders.

For more information on the Autism Tissue Program or how you can help support autism research, please call (888) 777-NAAR or visit www.naar.org EP

The Autism Tissue Program encourages families nationwide to enroll as organ donors so the brain tissue of individuals with autism and related family members can be used for research.

Eric London, M.D., is co-founder of the National Alliance for Autism Research and the parent of a son with autism.

Established in 1994, the National Alliance for Autism Research (NAAR) is the first private organization in the country dedicated to funding and accelerating biomedical research for autism spectrum disorders. The organization was established by parents of children with autism concerned about the limited amount of funding for autism research. To date, NAAR has committed more than $10 million in grants for biomedical research projects worldwide that seek to find the causes, prevention, effective treatments and, ultimately, cure for autism spectrum disorders. Walk F.A.R. for NAAR is the organization's signature fundraising and autism awareness event, which is held annually in numerous communities across the United States. Additionally, NAAR was instrumental in establishing the Autism Tissue Program, the first parent-led brain tissue donation program dedicated to autism research.

Five Early Signs of Autism

Connie Kasari, Ph.D., and Connie Wong, M.A.UCLA

Timmy was the perfect baby. Quiet and complacent, at 10 months he could play by himself for hours, allowing me to read the paper or do the housework. Unlike our friends' children, Timmy was so much less demanding of our attention. We just assumed he was very bright and independent. We began to worry, however, when his older sister celebrated her 4th birthday, and Timmy was only a year old. With all the friends and relatives around, he suddenly seemed withdrawn, preferring to crouch in a corner by himself, and at times crying as if there was too much commotion for him. Over the next several months, we began to notice other signs that concerned us. Timmy seemed not to notice our comings and goings as much, and by 18 months, still had not spoken a word. We talked to our pediatrician, but were told that he was likely just a little slow to talk-boys often are, and he has a big sister who likes to do things for him. When Timmy still was not talking at 2, we began to look for other help....

Although autism is usually diagnosed when the child is 3 to 4 years old, parents like the mother above often sense that something is wrong much earlier. On average, parents start to worry about their child's development by 18 months of age and voice some of their concerns to a doctor or another professional by age 2.

> **Using tapes and parent memories, researchers have developed the ability to spot signs of autism in very young children.**

But physicians and professionals are hesitant to diagnose autism at very early ages. They know that the early development of children varies, and are often uncertain if a behavior will persist into being considered atypical, or if behaviors that should be present will continue to be absent. If the child is labeled with a problem too early, parents may reduce expectations for the child and restrict the child's access to typical experiences and opportunities. Thus, professionals may take on a "wait and see" stance that delays diagnosis, and ultimately the commencement of intervention services.

Although such concerns are valid, the benefits of early diagnosis vastly outweigh the risks. These benefits include the relief parents may feel in having their concerns validated, and in their ability to address the problem as early as possible. As many studies have now shown, early intervention is critical for the best outcome in children with autism, and many believe the earlier the better. Only with a diagnosis can parents begin to obtain necessary intervention services for their child.

Given the potential benefits of early diagnosis, is it possible to reliably diagnose autism before age 2? The answer is yes. A number of researchers have now studied the early development of children with autism-a not so easy task given that the average age of diagnosis in the United States is 3 to 4 years of age.

Early development of children with autism has been studied by:

- screening large numbers of children for autism-specific behaviors during well-baby checks at 18 months of age;
- asking parents of children with autism to remember back to whether their child showed certain behaviors at certain developmental ages;
- and having parents bring in home videos of children diagnosed with autism when these children had their first or second birthday parties (which parents often videotape).

From these studies, five distinct areas of development are flagged for consideration. All parents should consider these "Big Five" if they suspect that their child may have autism.

1) Does the baby respond to his or her name when called by the caregiver? Within the first few months of life, babies respond to their own name by orienting toward the person who called them. Typical babies are very responsive to the voices of familiar people, and often respond with smiles and looks.

This article was supported by an educational grant from Janssen Pharmaceutica, L.P.

In contrast, infants later diagnosed with autism often fail to respond to their own name. That is, when called by name, they tend to turn and look at the person only about 20% of the time as found in the videotaped one-year-old birthday parties of children with autism. They also are often selectively responsive to sounds. They may ignore some sounds and respond to others that are of the same loudness. Thus, they may fail to respond to their parent calling their name, but immediately respond to the television being turned on. It is not unusual for parents to suspect their child has a hearing loss.

2) Does the young child engage in "joint attention"? Near the end of the first year of life, most infants begin to join with their caregivers in looking at the same object or event. To aid in this process of "joint attention", typical infants begin to shift their gaze from toys to people, follow other's points, monitor the gaze of others, point to objects or events to share interest, and show toys to others. These behaviors have a distinct sharing quality to them. For example, the young infant may point to an airplane flying over head, and look to the parent, as if to say, "do you see that!"

In contrast, young children with autism have particular difficulties in jointly attending with others. They rarely follow another's points, do not often shift their gaze back and forth from objects to people, and do not seem to share "being with" the caregiver as they watch and talk about objects, people, or events. They also tend not to "show" a toy to the parent.

3) Does the child imitate others? Typical infants are mimics. Very young infants can imitate facial movements (e.g., sticking out their

continued from page 61

tongue). As early as 8-10 months, mothers and infants say the same sounds one after another, or clap or make other movements. Indeed, imitation is a major part of such common infant games as pat-a-cake and So Big ("How big is baby? Soooo big!" as infant raises hands to sky).

Young children with autism, however, less often imitate others. They show less imitation of body and facial movements (waving, making faces, playing infant games), and less imitation with objects.

4) Does the child respond emotionally to others? Typical infants are socially responsive to others. They smile when others smile at them, and they initiate smiles and laughs when playing with toys and others. When typical infants observe another child crying, they may cry themselves, or looked concerned. Somewhat older infants may crawl near the person, pat, or in other ways offer comfort. These latter behaviors are suggestive of empathy and are commonly observed among children in the second year of life.

In contrast, children with autism may seem unaware of the emotions of others. They may not take notice of the social smiles of others, and thus may not look and smile in response to other's smiles. They also may ignore the distress of others. Several researchers have now shown that when an adult feigns pain and distress after hitting herself with a toy, or banging her knee, young children with autism are less likely to look at the adult, or show facial concern.

5) Does the baby engage in pretend play? Someone once noted that "play is the work of children." Young children love to pretend-to be a mother, father, or baby, to be a firefighter or police officer. Although children start to play with toys around six months or so, play does not take on a pretend quality until the end of the first year. Their first actions may involve pretending to feed themselves, their mother or a doll, brush the doll's hair, or wipe the doll's nose. Nearer their second birthday, children engage in truly imaginative play as dolls may take on human qualities of talking or engaging in household routines. Children may pretend that a sponge is a piece of food, a block is a hat, or a plastic bowl is a swimming pool that contains water.

The play of children with autism may be lacking in several ways.

In contrast, the play of children with autism may be lacking in several ways. The young child may not be interested in objects at all, paying more attention to the movement of his hands, or a piece of string. If interested in toys, only certain ones may catch his interest, and these may be used in a repetitive way that is not consistent with how most children would play with the toy. They may be more interested in turning a toy car upside down and spinning the wheels than pushing the car back and forth. Overall, pretend qualities are nearly absent in the play of children with autism under 2 years of age.

It is important to note that in each of the 5 areas we have flagged, we are most concerned with behaviors that are absent or occur at very low rates. The absence of certain behaviors may be more difficult to pinpoint than the presence of atypical behaviors. But concerns in any of the above areas should prompt a parent to investigate screening their child for autism. Several screening measures are now available, and information from the screener will help to determine if the parent should pursue further evaluations. If the parent is convinced their child has autism, then they should seek an evaluation with an expert in autism. Most likely, this evaluation will involve an interview with the parents to obtain a complete developmental history of the child, and direct observations of the child in different situations.

Luckily, Timmy and his parents were able to get the diagnosis of autism before Timmy's third birthday. They began intensive treatment with Timmy, and he made immediate progress. They are hoping for the best outcome, and feel confident that his early diagnosis was critical in getting him the help he needs to reach his potential.

Dr. Connie Kasari is a Professor in the Division of Psychological Studies in Education in the School of Education & Information Studies at the University of California, Los Angeles. She has engaged in research on children with disabilities for over 20 years, and currently has two federally funded projects on interventions with young children with autism and their families.

Connie Wong is a doctoral student in the Division of Psychological Studies in Education at UCLA. Her interests are in preschool-based services for children with autism, and the effectiveness of different teaching methods with these children.

Students with Disabilities and Graduation Exit Exams

LEVELING THE PLAYING FIELD

By Louise G. L. Nelson and Ann P. Turnbull

Andrew Fry is a hard working, 18-year-old young man with autism who attends a high school in Indiana. He receives individual assistance in math, English (reading) and writing. Andrew's dream is to become an employee at a natural history museum. Michelle, Andrew's mother, is concerned that Andrew will not be able to fulfill his dream. To gain employment at a museum, Andrew will need to have at least a standard high school diploma. To receive a standard diploma, Andrew must achieve appropriate grades in all of his classes and pass the state's graduation exit exam.

With the help of appropriate accommodations, Andrew successfully participates in the general education setting and is completing Indiana's "Core 40" program, the first step towards graduating with a standard diploma. This academic program requires students to choose from a list of specific classes each with assigned credits. Students are responsible for maintaining a C grade average in at least 40 core course credits across the major academic areas. The next step is to pass the state's graduation exit exam, I-STEP+. Although there are other options for high school graduation in Indiana, Andrew and his family believe this program would help him achieve his dream.

Michelle does not think she knows all of the possible exam accommodations that could be made available to Andrew, nor does she believe that these adjustments have been offered during IEP meetings. She thinks that if she knew where to find more information she might be able to push for more specific exam accommodations for Andrew.

To level the playing field in these cases, these students are allowed to receive accommodations during testing.

Most parents dream of the day their adolescent graduates from high school with a standard diploma. The diploma signifies that a student has met all of the school, district, and state requirements. For students with special needs, earning a standard diploma usually means that they will have better education and job opportunities after high school.

In some states, the dream of earning a diploma is becoming harder to achieve. Out of 50 states, 15 require all students to complete specific high school classes with passing grades and pass a minimum competency or graduation exit exam which varies from state to state. Some states have other options for gaining standard diplomas, but many families think students with special needs should be given equal opportunities to take and pass their state or district's graduation exit exam. To level the playing field in these cases, these students are allowed to receive accommodations during testing. Unfortunately, parents are not often given information about the types of allowable and helpful accommodations available. The following questions and answers can help them learn about and promote the best possible accommodations for their adolescent with a disability.

Why do students with special needs participate in graduation exit exams?

Graduation exit exams belong to a family of assessments or tests called large-scale assessments. The exams measure students' learning at the state or district level and almost every state and many school districts have their own assessments. The purposes for these tests range from measuring students' performance to making sure that students are learning what the

continued on page 64

continued from page 63

state and/or district believe they should know as a result of a high school education.

Congress passed three pieces of legislation to help measure achievement. The Improving America's Schools Act and Goals 2000: Educate America Act together emphasize higher academic expectations for all students, improved student performance and more thorough measures of student achievement. A third piece of legislation, the Individuals with Disabilities Education Act (IDEA), makes sure that students with special needs are included in this national push for higher expectations and improved student performance by requiring states to include all students in statewide assessments. (See resources to find additional information.)

In an effort to conform to all three acts, 19 states have gone a step further and have mandated graduation exit exams. Students must pass these exams to receive a standard diploma. 15 of these 19 require all students to pass the graduation exit exam: Alabama, Arizona, Florida, Georgia, Indiana, Louisiana, Maryland, Mississippi, Nevada, New Mexico, New York, North Carolina, South Carolina, Tennessee, and Virginia. Three states, Minnesota, New Jersey and Ohio, do not require some students with special needs to take the graduation exit exam to receive a standard diploma, deferring to each student's individual education plan (IEP). Texas has an alternate exam that students with special needs must participate in to receive a diploma.

In some states there are alternate exams available, but in most cases these are only for students who work primarily on life skills and other education skills that are not in the general education curriculum.

Why is it helpful to include students with disabilities in graduation exit exams?

Before legislation specific to expectations was enacted, the levels of expectations for students with special needs, as compared to their peers, varied. Most of the time, the expectations were lower and sometimes they varied, even between schools in the same district. In addition, teachers, districts and states were also not held accountable for what they taught these students. These low levels of accountability allowed students with special needs to graduate with a diploma, but many of these students were not prepared for life after high school.

These students did not have the skills their non-disabled peers had, so they were not as readily employed. To combat these minimal expectations and lack of educator accountability, schools, districts and states are now required to include the scores of students with disabilities with all other students who take the same assessment. This pushes schools, districts and states to recognize that students with special needs must be taught the same core curriculum and be given the opportunity to learn the same information as their peers.

How can parents argue for improvements in the quality of instruction?

The biggest impact that parents can have in their child's education is to become involved, to be active monitors of what is taught in the classroom. By learning about their state's and district's expectations for all students, parents can help make sure that what is taught in the classroom meets requirements. Title I of the Elementary and Secondary Education Act specifically identifies parent involvement as a crucial part of improved instruction for all students. (http://neighborhoodlaw.org)

The website of the Center for Law and Education (http://www.cleweb.org) has several articles on how parents can make sure their child is learning. The RMC Research Corporation (http://www.rmcres.com) includes a piece explaining what parents can do to make sure that their child's school holds high academic expectations for their students. All of these articles recognize the importance of a parent's active participation in their child's education as a basis for improving instruction.

Do all students, regardless of their disability, take the same graduation exit exam?

Students with disabilities in the 15 states identified earlier have the opportunity to take the same graduation exit exam as their peers. In some states there are alternate exams available, but in most cases these are only for students who work primarily on life skills and other education skills that are not in the general education curriculum. To show advancement in learning, these students need an assessment that is more individualized. Alternate exams assess the knowledge and skills of this student group through processes including, but not limited to, individual interviews (one-to-one teacher student interviews about the student's accomplishments), portfolios (a collection of the student's work that shows the student's broad range of abilities) and adapted assessments (assessments that have been altered in length, material given, answer format). Texas is the only state that offers the alternate exam as a way for students with special needs to earn a standard diploma.

Table 1

Accommodations from Across the States

The Four Areas Presentation Response Setting Timing/Scheduling Descriptions The oral presentation or the written appearance of the assessment. Neither presentation method disqualifies the exam by paraphrasing, shortening, or otherwise altering the exam. The student's method of conveying his or her answers. The student's answers must be scripted, typed, or otherwise recorded exactly as the student stated them. The location or setting where the student takes the exam. The location must be monitored. The amount of time a student is allowed to complete either sections of the exam or the entire exam.

Examples:

1) A student with poor vision is provided with an exam that has larger print.

2) The instructor reads the directions and questions out loud to the students.

Examples:

A student says out loud which "bubble" he/she wants marked and the scribe fills in the bubble.

2) A student types their answers to an essay question into a word processor

Example:

The student takes the exam in a room with no other students.

A small group of students take the test in a room to themselves.

Example:

The student is allowed extended time to complete the written section of the exam.

The student can take as many breaks as he/she needs to be able to concentrate on the exam.

Can parents ask for modifications or accommodations to the graduation exit exam?

Before answering this question, the terms modifications and accommodations need to be defined: they are two different forms of support that help students with special needs become an active part of the general education classroom.

Modifications are changes made to instruction or materials that help students work towards the same goals as their peers. For example, modifications to an exam might include the deletion of some items on the test, abbreviated instructions, or a shortened essay question. Modifications to large-scale assessments are not allowed. Because of this, states are now recognizing the need to assess the skills of students who are unable to complete the large-scale assessment. Therefore, the use of these alternate assessments for identified students has increased.

Accommodations are changes to the academic environment or the presentation of the material and are allowed in varying degrees by states and districts on graduation exit exams. Examples include small group or individual settings, extended time to complete the exam, the repetition of instructions when needed, or students being allowed to tape record their responses to an essay question. Appropriate accommodations, typically the same ones that help the students succeed in the classroom, can help students perform their best on a graduation exit exam.

What accommodations can parents request?

The accommodations allowed for graduation exit exams vary by state and sometimes by district. It is important that any accommodation match the student's needs and cannot be interpreted as an unfair advantage offered to the student on the graduation exit exam. The National Center on Education Outcomes (NCEO) gathered information about large-scale assessments and grouped the different types of accommodations into four areas: presentation, response, setting, and timing/ scheduling. Not every state grants accommodations in each of these areas, but it is important for parents to know what other states and districts allow so they can advocate for additional appropriate accommodations for their adolescent. The following table gives brief descriptions of each of the areas.

How can parents effectively promote test modifications for their adolescent with special needs?

Just as parents advocate for their adolescent with special needs in the classroom, they need to do the same for accommodations during graduation exit exams. To be effective, parents need to be knowledgeable about the state requirements for these tests. Table 2 provides basic information on the graduation exit exams of 15 states, including a state contact person or department who can answer questions. To help their student prepare for the test, parents can:

- Set and maintain high expectations for their adolescent and ensure that all pro-fessionals involved with him or her do, too.
- Ask about the four accommodation areas included in Table 1. Often, the student must be receiving a specific support in the general education classroom to be provided with accommodations during the graduation exit exam.

---

* The data in this Table is current as of 9/25/02. Any states that have added Graduation Exit Exams to their curriculum since 12/01 have not been added.

* * Some colleges and universities use the TAAS exam as an entrance exam. If a student is exempt from the TAAS and wants to attend one of these colleges or universities, this student will be required to take the SAT.

* * Applicable to graduating classes where the freshman class begin in 2001 or after.

Andrew performs better in testing situations when he receives individual attention because the attention helps relieve test anxiety and the lack of distractions helps him to focus.

continued from page 65

- Review past graduation exit exams. These are often found on the state's education web site.
- Find out the testing procedures used in the state or district.
- Talk to their teenager about the test. Parents can stress the importance of the exam without instilling fears or raising doubts in the adolescent.
- Ask school personnel to help them interpret the results of the test.
- Talk about their adolescent's goals for the future, what necessary steps should be taken to meet those goals and determine whether there is an alternative to the graduation exit exam that better suits their adolescent's needs.
- Ask questions.

Students with special needs who live in the 15 states that have graduation exit exams are being held to the same high expectations as their general-education peers. Parents can help their teenager with disabilities to participate more confidently in the graduation exit exam by being well informed about the exam and by advocating for appropriate accommodations.

To date, Andrew has taken the I-STEP+ twice. When the results of his first attempt came back in January of 2001 and he had not passed the exam, Andrew was required to take remedial math and English classes during the second semester of his sophomore year. He was also required to take a summer school class specifically to help him prep for the I-STEP+ during his junior year. Before he took the exam in September 2001, Andrew chose to participate in one-hour review sessions that were held on the five days before the exam. He also worked with his private tutor on additional skills.

Michelle appreciates this extra support for Andrew, but she has been disappointed with the accommodations provided. Although Andrew was in the resource room when he took I-STEP+, he was still in a group setting. Andrew performs better in testing situations when he receives individual attention because the attention helps relieve test anxiety and the lack of distractions helps him to focus. The one accommodation offered to Andrew was to allow him to get up and walk around the room periodically. Michelle understands the necessity of I-STEP+ and why certain modifications cannot be made to the exam. She also knows that with appropriate accommodations—one-on-one instruction, extended time, additional breaks during the testing—Andrew is successful in the general education classroom. Michelle realizes that she must continue to work at bridging the gap between what is offered in the classroom and what is offered during the exam. EP

Louise Lord Nelson was a special educator in Indianapolis, IN for eight years. She is currently a doctoral candidate at the Beach Center on Disability at the University of Kansas.

Ann Turnbull is a Professor in the Department of Special Education and Co-Director of the Beach Center on Disability at the University of Kansas. She has authored 12 books and over 175 articles and chapters. She is the parent of three children, one of whom is an adult son with cognitive and mental health disabilities.

PART TWO

Recognizing and Tracking Pain in Children with Developmental Disabilities

Sally Colatarci,
RN, MS, FAAMR and
Wendy M. Nehring,
RN, PhD, FAAN, FAAMR

AAMR

AAMR promotes progressive policies, sound research, effective practices, and universal human rights for people with intellectual disabilities.

There is a growing recognition that it is important to know how to recognize pain in children, especially non-verbal children with developmental disabilities, and ways to help manage the pain.

Parents know their child best and are the best advocates for their child and their child's pain management. As we state throughout this column, it is important to know how to assess whether your child is in pain, how bad the pain is, where the pain is located and what works best for your child's pain. (This latter point will be addressed more fully later in this series.)

Pain is an individualized experience. We all experience pain at some time in our lives and how that pain affects the quality of our life and what measures work to decrease or eliminate the pain will differ for every person.

Individuals have different ways of expressing their pain. If someone says that they are having pain, believe them, no matter what their cognitive ability, because they are experiencing pain.

There are no ideal assessment tools available for children with developmental disabilities, so it is important to find something that works best for your child. Research has shown that children with developmental disabilities are assessed less often for pain, have their pain level underestimated and are given less pain medication than children without developmental disabilities by health care professionals. However, hospitals and physicians' offices also have a new appreciation of pain in all patients and healthcare personnel are learning to be more sensitive to pain relief needs.

In this column, we will explain ways to recognize and assess pain, manage the pain and advocate for proper control of pain in children with developmental disabilities.

Recognizing and Assessing Pain

There are a number of ways that a child tells us that he or she is in pain. In infancy, that way is to cry, although it is often difficult to know where the pain is. As the child gets older, they

continued on page 70

This is the second in a monthly series written for EP Magazine by members of the American Association on Mental Retardation (AAMR).

A pictorial scale or a number scale may work for a child with higher cognitive functioning, whereas, for someone who is nonverbal and with low cognitive functioning, a facial scale for infants may be more appropriate.

continued from page 69

learn words that they can use to tell us they have pain, where the pain is located and to describe how the pain feels (e.g., stabbing, sharp, dull, all over, etc.). A child with developmental disabilities may not be able to do this. It is important that parents be able to recognize when their child is in pain. A list of these physical signs are given below:

- ☐ Increased crying, that may be inconsolable
- ☐ Facial grimaces not regularly seen
- ☐ Increased physical movements which may include self-injurious behaviors (e.g. biting)
- ☐ Rocking and/or head banging
- ☐ Increased sounds, such as grunting
- ☐ Less playful
- ☐ Change in eating habits
- ☐ Change in mood, depressed, sad, irritable, withdrawn, and/or less cooperative
- ☐ Flushed skin

A health professional may also note that there may be a rise in temperature, an increase in blood pressure and a higher heart rate.

Children who are verbal and know words to use for pain may choose not to tell a parent that they are in pain. This may be because they think the parent already knows that they do not know what to do and/or they are scared that if they tell they will have to see a health care professional, go to the hospital and/or have a procedure (e.g., a shot) that will further be painful. Other children may not know the words to use to tell about their pain and are poor reporters of where it hurts and how much it hurts. Parents should be aware that some neurological conditions affect pain sensors and the sensation of the pain for the child is altered.

Here are some questions that you can ask your child:

- ☐ Tell me about a time when you had pain before. Where did it hurt? How bad did it hurt? For how long did it hurt? Do you know what started the pain?
- ☐ Who do you tell when you have pain?
- ☐ What helps to take away the pain?
- ☐ What do others do to help you with the pain?
- ☐ Are there any equipment (e.g. sign boards) or other ways that you use to tell others about your pain?

Here are some questions that parents need to consider and be able to answer when asked by health professionals?

- ☐ Tell me about your child's pain experiences.
- ☐ How do you know that your child is in pain?
- ☐ What signs does your child show and/or what words does your child use?
- ☐ What ways does your child communicate that he or she is in pain?
- ☐ Does your child let you know when he or she is in pain?
- ☐ How much pain is your child having when they tell you?
- ☐ Is it when the pain first begins or after the child has been in pain for awhile and it is getting worse?
- ☐ How do you deal with your child's pain?
- ☐ What do you do for him or her?
- ☐ Does your child do anything first for him or her self to stop or reduce the pain?

What do health professionals need to know about your child's pain and how to manage it when you are away?

It is important that parents know the answers to these questions and are able to advocate for their child. Writing this down and having copies will help the parents avoid having to repeat themselves or try to remember every detail, each time someone new sees their child.

There are also a number of instruments used to assess pain in children without developmental disabilities. These scales vary depending upon the child's age and range from identifying the degree of pain by picking out a picture of a face among a range of faces (e.g. Whaley and Wong's Faces Scale) to indicating on a scale, say from 1-10, with 10 being the worse pain imaginable.

A pictorial scale or a number scale may work for a child with higher cognitive functioning, whereas, for someone who is nonverbal and with low cognitive functioning, a facial scale for infants may be more appropriate. For children who are nonverbal, the appropriate pain assessment tool depends on the child's level of cognitive deficit.

Relying only on doing "what the doctors tell me to do" will help your child in only a limited way. Being sensitive to your child's signals and learning how to differentiate the meaning of these signals will be important to optimally managing your child's pain. Maintaining a diary and/or a handout that describes your child's signals of pain, diversion activities and appropriate pain management will help your child when you cannot be present. Understanding your child's pain and how to manage it will help decrease anxiety, worry and sleeplessness for children as well as their parents. EP

> Maintaining a diary and/or a handout that describes your child's signals of pain, diversion activities and appropriate pain management will help your child when you cannot be present.

Fashion In a Snap

By Lori Ostrover

While there is a fashion revolution in such groups as plus sizes and maternity clothes, the same has not occurred in the disability community. Judi Cohen, the owner of the adaptable clothing line WeBehave.Com, is determined to make a difference. She feels very strongly that fashion for people with disabilities should not be compromised. *"Especially for kids; there are still ways to look 'cool' and in style," she says.*

Cohen has taken an eighties fad and made it one of the best sellers in her company. Called Lastic Laces, they eliminate the need for anyone to ever have to tie their own shoe.

These extra curly, stretch cord laces come in goofy colors and were originally designed for challenged individuals, however, they crossed over into the mainstream.

Now they're back being helpful to individuals with disabilities. Lastic Laces make any shoe into a comfortable slip-on. This is beneficial since no one has to bend over, use his or her arms, hands, upper body or eyes. You can log onto the website www.WeBehave.Com to order.

Pip Squeakers makes shoes for kids under the age of five. Every time the child takes a step the heel of their foot will set off a squeak. Because parents can always hear where the child is stepping, it is possible to give the child greater freedom and a better sense of independence. They are made of silky, durable fabric.

One particular sandal comes in blue or red and has a 'funky' star-pattern along the sole. An added bonus, when children are in the early stages of walking, the noise is enticing and makes them eager to take more steps.

Markell Shoes have created a true orthopedic sneaker for children with ankle-foot orthoses (AFO) called the TM2000. The sneaker is constructed with added depth and greater width, which makes it easy to slip the foot and the AFO device into the shoe comfortably. Shoes from other companies like Quality Care Therapeutic Shoes customize their products for the more mature individual.

The shoes are heated up with a heat-gun and then conformed to a person's foot. This is great for children whose feet might be turned inward as well as adults with diabetes.

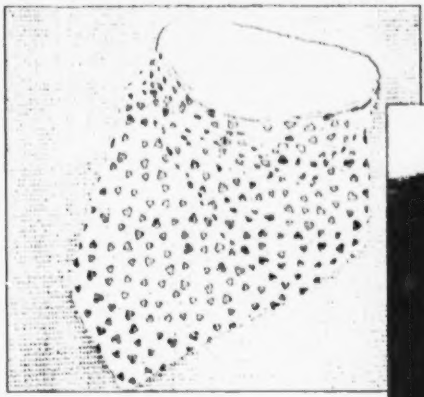
Lastic Laces from WeBehave.Com

Know Your Fabric

Choosing the right fabrics should always be taken into consideration. If a person has perspiration problems it is important to wear more natural fibers which allows more breathing room. The right fabric will also let perspiration evaporate so an individual does not feel damp or chilled.

Cotton is great in the heat. It is much more absorbent than synthetic fabrics such as polyester and nylon, which tend to trap moisture, which is also important for people who have drooling problems.

There is a way to make a bib look more stylish. Companies such as David's Collection, Able Apparel, WeBehave.Com and Adrian's Closet make 'bandana' bibs. They are made of cotton fronts and are backed with breathable fabrics such as goretex



Bandana Bib from Adrian's Closet (hearts)

Bandana Bib from Able Apparel

and terry cloth. They keep the individual dry without creating additional sweating problems. The bibs also prevent clothes from getting soggy and consequently, cut down on illness due to sudden chills.

WeBehave.Com makes this 'bandana' style bib in an attractive blue denim. Able Apparel manufactures them in plaid patterns of pastel colors. They even make a bib out of gold or silver lame for formal occasions. Adrian's Closet makes one that is covered in little hearts and is pleated at the neckline, giving it more of a stylish accessory look. These products add to the dignity of the wearer.

Wool and fleece fabrics are effective in keeping warm from cold weather. Able Apparel makes a multicolor fleece jacket, which contains an easy and accessible back closer. The color combinations are designed to blend in with more conventional garb.

They also make thumbless mittens out of fleece that are slipped onto the hand through zipper openings. Rolli Moden makes half finger gloves that mimic gloves worn by motorcyclists, but are designed for people in wheelchairs. They're made of leather with gel padding to protect the palms of individuals confined to wheelchairs. The finger tabs allow the glove to be removed from the hand with ease.

The weight of fabric is also important when it comes to adaptable clothing. Heavy fabrics like canvas and corduroy can be exhausting when worn frequently. This particularly affects individuals who are required to wear protective headgear.

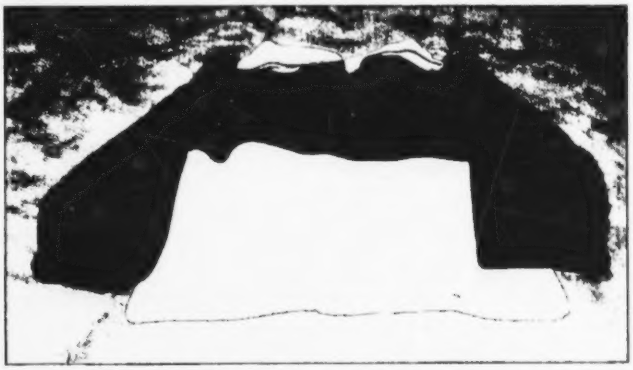
There has been a misconception that headgear had to be hard, bulky and heavy. Plum Enterprises' Inc. soft ProtectiveWear® line offer customized headgear for individual's needs, at any age.

The ProtectaCap® has additional shock absorption and is virtually weightless. The soft fabrics make it machine washable. It provides kid safety and an increased self-esteem.

The company also makes a ProtectaHip® that has the same consistency of the headgear along with a fully elasticized waistband. Recently, the American Society on Aging made it the Outstanding Product Design of the Year, declaring, "it is a simple solution to a serious problem."

Knit fabrics as opposed to woven are more comfortable, especially when sitting because they don't bulk up as much. Nylon is actually a better fabric when seated. Adrian's Closet makes a pair of nylon pants with zippers from top to bottom on each side of the pant leg. The elastic waist prevents bunching and the smooth fabric provides comfort. These pants are considered by many to be very stylish and practical at the same time.

Thumbless Mittens from Able Apparel



Multi-color fleece jacket from Able apparel. The strip of velcro goes all the way down the back

For more information about adaptable clothing check out the book Dressing Tips and Clothing Resources for Making Life Easier by Shelley Schwartz. It is filled with interesting information for the special needs community and is available in the EP library.

Get Creative

Everyone has his/her own

continued on page 74

continued from page 73

requirements and desires when looking for adaptable clothing. The best way of establishing an individual's style is to modify existing or standard clothes. An individual can buy the latest fashions and make magic by adding the personal touch and aides needed to make their clothes adaptable.

If shirts that button down are troublesome, sew the buttonholes closed and attach some velcro squares where the holes were. On the other panel, underneath the buttons, attach the other side of the velcro. This gives the satisfaction of dressing independently and the buttons on the outside of the shirt keep the same look.

Do the same with zippers on pants or skirts. Try putting large loops of bias tape inside the waistband of an individual's bottoms making them much easier to pull up. The exact location and length will vary depending on their needs.

Jill Kamphaus, happy as always, wearing one of her many owned ProtectaCaps®

Use items of clothing bought in any apparel store, open up the back seam and put velcro all the way down. This is a great trick for an individual with limited upper body movement. Sometimes cutting out a v-neck for more room to pull over the head will make a top look cool.

DRESSING
TIPS
CLOTHING
RESOURCES
for making life easier
SHELLEY PETERMAN SCHWARZ

Shelley Peterman Schwarz's insightful book, full of tips and trends "for making life easier".

Add personal touches and fashion flair and find a nice pendant or even a key chain to attach at the end of any zippers located on garments, including jackets. This will enable much more ease pulling the zipper shut. Craft stores are great to browse through to find stylish trimmings. Perhaps an individual might want to add rhinestones to a particular shirt. This look is very popular among all kids. Ribbons, puffy paints and patches are a few other options, which might appeal to a child. These ideas will help save money. Family service agencies or the Department of Rehabilitation might reimburse for clothes if it means independence and tax deductions may be available. EP

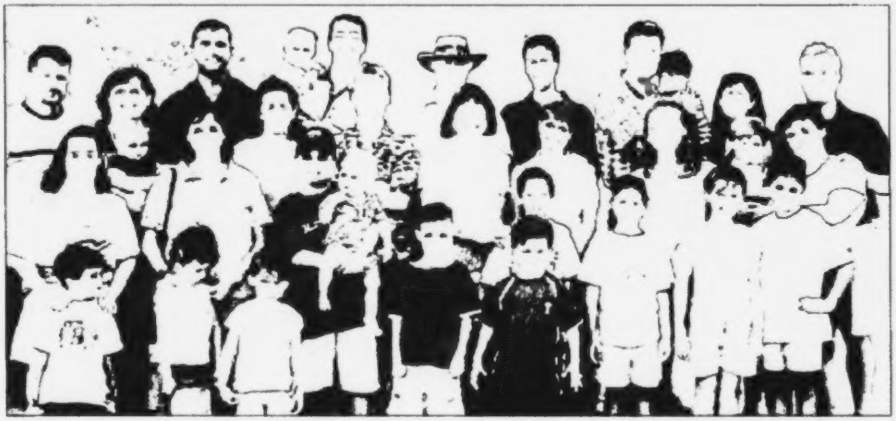
A Celebration of a Life!

Yvonne Catherine Fitzpatrick Murphy

Mrs. Yvonne Catherine Fitzpatrick Murphy of Atlanta, Georgia died October 6, 2002 at the age of 66. She fought her battle against esophageal cancer with great faith and dignity; she was truly a woman of valor. Mrs. Murphy was the wife of Frank J. Murphy, President and CEO of the EP Foundation for Education, Inc. (EPFE). In addition to Frank, she is survived by seven daughters, six sons-in-law, 17 grandchildren and a host of friends.

The Murphys' youngest daughter, Karen, has Down syndrome, and both Yvonne and Frank have been active parent advocates, first with the National Down Syndrome Congress and, more recently, with EPFE. Yvonne was on hand for the World Congress & Exposition on Disabilities in Atlanta in both 2000 and 2001, and was sorely missed at the just-concluded conclave in Orlando, Florida.

A true lady, Mrs. Murphy was gentle, soft-spoken and charming. ***All of us at EP will miss her very much.***



This picture was taken on the beach at Pawley's Island, South Carolina, on August 2, 2002. It is of Frank and Yvonne Murphy and their entire family, 32 in all. Across the front, left to right: Michael Oliver, Rachel Miller, Kasey Farrell, John Bleekrode, Blake Farrell. Next row back: Karen Murphy, Joan Miller, Kevin Bleekrode, Brendan Bleekrode (in his arms,) Emily Oliver, Catherine Oliver, Mary Beth Bleekrode, Sarah Oliver. Next row back: Phelim Farrell, Sandy Farrell, Page Yvonne Farrell (in her arms,) Mary Oliver, Joey Bleekrode, Yvonne Murphy, Julia Ehlers, Katie Bleekrode, Janice Givens, Timmy Bleekrode (in her arms,) Laura Bleekrode. Back row: Lyndon Oliver, Murphy Givens (in Rich's arms), Rich Givens, Frank Murphy, Barry Ehlers, Mark Miller, Ben Miller (in his arms), Kim Bleekrode.

A Randomized, Controlled Trial of a Community-Based Support Program for Families of Children with Chronic Illness: Pediatric Outcomes

Children with chronic illnesses, who are at increased risk of developing mental health problems, can reduce that risk by participating in community-based support programs, according to a recent study.

Conducted in Baltimore, MD, the study involved 136 mothers and children aged seven to eleven years. Each of the children had one of four conditions: diabetes mellitus, sickle cell anemia, cystic fibrosis, or moderate to severe asthma.

The study included a control group, and used four methods of mental health evaluation. These were the Personal Adjustment and Role Skills Scale III, the Self-Perception Profile for Children, the Revised Children's Manifest Anxiety Scale, and the Children's Depression Inventory.

continued from page 77

The 15-month, community-based program was provided by child life specialists and "experienced mothers." It included contact through telephone calls, face-to-face meetings, and special events involving the family. Child and parent mental health reports were taken as they entered the study, then one year later, to determine mental health at baseline and any changes that took place during the study period.

A cutoff score was chosen to indicate maladjustment; the experiment found that the percentage of children in the control group who fell in the maladjustment range at baseline increased from 15 percent to 21 percent over the course of the project. Conversely, the percentage of children in the experimental group who fell in the maladjustment range was nearly cut in half: 19 percent of experimental group children fell in the maladjustment range at the beginning, compared to 10 percent by the end. In particular, children with low physical self-esteem at the beginning of the program experienced a more pronounced effect than children whose physical self-esteem was moderate to high before the intervention project.

The experiment showed that family support intervention has positive effects in promoting mental health and adjustment in children with these four chronic health conditions, and especially in children with low physical self-esteem. Because the program was comparably helpful to children with each of the four disorders included in the experiment, the results suggest that this type of community-based intervention may be helpful to children with all kinds of chronic illnesses. EP

The experiment was conducted by Robin G. Chernoff, MD, Henry T. Ireys, PhD, Katherin A. DeVet, PhD, and Young J. Kim, PhD.

For more information on the experiment, visit http://archpedi.ama-ssn.org/issues/v156n6/ abs/ poa10379.html or contact Robin G. Chernoff, MD, Department of Pediatrics, The Johns Hopkins School of Medicine, 600 N Broadway, Baltimore, MD 21287 (e-mail: rchernof@jhmi.edu)

The Value of DO-IT to Kids Who Did It!

by Sheryl Burgstahler

Individuals with disabilities experience far less career success than their non-disabled peers. However, as in the general population, differences in achievement diminish with more education. Only 16 percent of people with disabilities with less than a high school diploma participate in the labor force, compared to 30 percent of those who complete high school, 45 percent of those with some postsecondary education, and 50 percent of those with at least four years of college. Without a postsecondary degree or job experience, people with disabilities have a harder time finding challenging careers.

High-tech careers are particularly desirable because of advancements in assistive technology that provide access to computers and scientific equipment for people with a variety of disabilities. This column shares information about a program that promotes college and career success and lessons learned that can be applied by those who work with young people who have disabilities.

THE DO-IT SCHOLARS

DO-IT (Disabilities, Opportunities, Internetworking, and Technology) at the University of Washington (UW) in Seattle sponsors a program that is creating leaders, mentors and role models for the next generation. The DO-IT Scholars program uses computers, the internet, assistive technology, summer study programs, internships and other activities to prepare young people with disabilities for college and careers. Most students begin participation in the DO-IT Scholars program during their sophomore year of high school.

COMPUTERS, ASSISTIVE TECHNOLOGY AND THE INTERNET

DO-IT Scholars are provided with computer equipment, any needed assistive devices and internet access in their homes. They use information resources and communicate year-round with each other, project staff and mentors. When asked about the most valuable skills they gained through DO-IT participation, more than 80 percent of past Scholars rated computer and internet skills as the

continued on page 80

Dr. Sheryl Burgstahler is the director of the DO-IT (Disabilities, Opportunities, Internetworking, and Technology) program. DO-IT is funded by the US Deptartment of Education, the state of Washington and many other organizations. DO-IT serves to empower young people with disabilities as they transition to college and careers through the use of computers, assistive technology and the Internet. "Tech Talk" is designed to address practical ways of integrating technology into educational, work and home environments. Dr. Burgstahler will also answer readers' questions through this column. Please send correspondence to: Dr. Burgstahler, University of Washington, Box 354842 Seattle, WA 98195; fax: (206) 221-4171; e-mail:sherylb@u.washington.edu.

Camphill Special School
Children's Village
A not-for-profit residential school community where children with developmental disabilities are truly celebrated.

Is your child receiving a caring and compassionate education?

Since 1960, the families at Camphill Special School have invited children with special needs into their homes and into their hearts; living together as extended families they share the daily rituals of meals and chores, as well as the challenges of school and therapy.

Each House Parent has received specialized training and is prepared to nurture your child's capabilities and guide them toward a brighter future.

continued from page 79

most valuable. These skills enhance their academic and career opportunities as well as their ability to communicate efficiently with mentors and peers. One Scholar summarizes the greatest impact of the program this way: "DO-IT has shown me that information is empowerment and that through computer and social networking there is virtually free access to information for everyone."

MENTORING AND PEER SUPPORT

DO-IT Scholars use electronic communications and personal meetings to connect with postsecondary students and career "mentors." "Mentors [show] how you can be successful in your chosen field despite your disability," shares one Scholar. Most of the mentors have disabilities themselves. Through mentors, students learn how to be more independent, to advocate for themselves and to persevere.

Experienced Scholars mentor younger participants. The communication and leadership skills they develop extend beyond the Scholar program. One parent reports that her son, a Scholar with attention deficit disorder (ADD), helped another child with ADD "by taking the boy to register for high school and showing him around so he will know where things are on the first day of class."

DO-IT staff and mentors pose discussion questions to the group and share information about school, internships and other useful resources. Smaller groups focus on specific access challenges. For example, in the "doitvi" group, Scholars and mentors share technological and other strategies to compensate for a visual impairment. After participating in DO-IT for several years, one Scholar summarizes, "I've been prepared for my future in academic, social and employment aspects. I'm excited and eager to see what the world has to offer now that I've participated in the DO-IT program, not to mention all the great friendships and fun times I've had." DO-IT has shown that peer and mentor support, traditionally provided in person, can be delivered via a supported electronic community on the internet.

SUMMER STUDY

The DO-IT Scholars program involves summer study sessions held during two consecutive summers on the University of Washington campus. Scholars learn how to maneuver through a large campus, request disability-related accommodations, get along with a roommate and succeed in college courses. They begin to explore different career fields.

Scholars report developing social skills and self-determination skills that lead to success in academics, employment and adult life. They also become more aware of the challenges other students face as they work with peers who have a wide variety of disabilities, including sensory impairments, mobility impairments, learning disabilities, chronic health conditions and psychiatric disorders.

In a science lab, for example, it is not unusual to find a blind student working with someone without the use of his hands to perform bypass "surgery" on a sheep heart. The two learn quickly how, using the combination of skills they possess, they can follow the instructions and get the job done. Everyone needs to participate in DO-IT activities. One past Scholar says that participation in DO-IT helped him to realize "that I can have a normal adult life and that my disability really should not stop me from pursuing a career that is interesting to me."

DO-IT does not end on the last day of the on-campus program. As soon as Scholars return home, they log on to the internet to continue their friendships. "It's kind of like going to summer camp," reports one Scholar, "but to a certain extent I don't ever have to go home."

WORK-BASED LEARNING

During the third year, Scholars have the option to return to the DO-IT summer study program as interns. They learn about all of the work that goes on behind the scenes to make the program a success. They participate on panels to share their experiences with the younger participants, and in other ways help them transition successfully to college. During the year, opportunities to participate in social get-togethers and conferences, as well as internships in high-tech companies, are available to the Scholars.

SIGNS OF SUCCESS

The DO-IT Scholars program has demonstrated success in helping young people with disabilities pursue college and careers. Of the 168 Scholars who have graduated from high school, 151 (90 percent) are currently attending or have attended college. Twenty-six have graduated from college and five are enrolled in graduate school. Two have completed Masters degrees. Their fields of study and employment include biology, business, chemistry, computer science, ecology, engineering, mathematics, nutritional sciences, pediatric psychiatry, physical therapy, physics, premedicine and speech and hearing sciences. One Scholar who is blind completed degrees in mathematics and computer science and is now a Rhodes Scholar at Oxford.

When Scholars were asked which specific skills the DO-IT summer study program helped them develop, 65 percent reported social skills, 59 percent reported career/employment skills and 47 percent reported academic skills. When Scholars were asked what specific skills computer and internet activities helped them to develop, 67 percent reported academic skills, 61 percent reported career/employment

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in EXCEPTIONAL PARENT.

How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly.

Be sure to tell them you saw their ad in EXCEPTIONAL PARENT!

continued from page 81

skills and 51 percent reported social skills. One Scholar summarizes, "I think the greatest impact for me is, it helps me to understand more about myself and the people in the real world. I have learned how to adapt to society without thinking that I am disabled, that I am useless."

When parents were asked to what degree DO-IT enhanced their children's lives, the highest-ranked items were interest in college, perception of career options, self-esteem and self-advocacy skills. Parents ranked social skills highest, followed by career/employment skills and academic skills as those most developed through summer study. Of the computer/Internet aspects of DO-IT, career/employment skills ranked highest, followed by academic and social skills. As summarized by one parent, "My son has benefited greatly from the DO-IT program. He was able to realize that many other students had to struggle through school. DO-IT camps allowed students to bond and the computer networking allowed them to continue to support each other through the year. He did not think much about his future until he attended DO-IT Camp. He came home talking about his college plans, with confidence that he could manage it. DO-IT has also helped my son get a part-time job for his first year of college. ... He has achieved a level of independence we never thought possible."

LESSONS LEARNED

What lessons can be learned from the DO-IT experience that can help educators, program developers and families help young people with disabilities transition to college studies and careers? Successful strategies include:

COMPUTER AND INTERNET ACCESS

Give students with disabilities access to computers, assistive technology, electronic communication and internet resources at an early age. Make sure computing resources in schools, such as computer labs and educational software, are accessible to students with disabilities.

PEER SUPPORT

Help connect college-capable young people with disabilities with other teens who have disabilities. Encourage relationships among students with a wide variety of disabilities; these connections can help them understand their own challenges and solutions and gain insights into the potential and accommodation needs of others. Being more aware of challenges faced by other people can help them become leaders and mentors to others.

MENTOR SUPPORT

Create situations where young people with disabilities can gain access to role models who have disabilities and are successful in demanding careers. Promote mentoring relationships between young people and adults with disabilities. Employ the internet to sustain these relationships.

COLLEGE PREPARATION

Have students visit college campuses, learn about resources and become experts on the assistive technology and other accommodations they need before the end of their high-school years. Offer programs that bridge the gap between high school and college, between two-year and four-year schools and between undergraduate and graduate studies. Encourage them to take high school courses, such as math and science, that will maximize their options for academic majors when they go to college.

WORK-BASED LEARNING

Provide opportunities for young people to participate in paid and unpaid work experiences. Through internships, job shadows, volunteer work and other work-based learning experiences, they can prepare for future employment, learn how to self-advocate for accommodations and practice job-related skills. Seeing their own potential for stimulating careers will also motivate them to succeed in school. **EP**

Dr. Sheryl Burgstahler is the director of the DO-IT (Disabilities, Opportunities, Internetworking, and Technology) program. DO-IT is funded by the US Department of Education, the National Science Foundation, the state of Washington and many other organizations. DO-IT serves to empower young people with disabilities as they transition to college and careers through the use of computers, assistive technology and the Internet. "Tech Talk" is designed to address practical ways of integrating technology into educational, work and home environments. Dr. Burgstahler will also answer readers' questions through this column. organizational spotlight

IFOPA: International Fibrodysplasia Ossificans Progressiva Association

By Marilyn Hair, Vice President

Dr. Fred Kaplan and Thirteen-year-old Tiffany Linker Mark

In 1692, French physician Guy Patin wrote, "I saw a woman today who finally became hard as wood all over." This is the earliest clinical description of fibrodysplasia ossificans progressiva (FOP), a rare genetic disorder that causes bone to form in muscles, tendons, ligaments and other connective tissues. Bridges of extra bone form in characteristic patterns, progressively restricting movement. In FOP, the body produces an extra skeleton that immobilizes the joints of the body. FOP affects approximately 2,500—one in two million people—worldwide.

Children with FOP appear normal at birth, except for a congenital malformation of the great toe. Typically, during the first decade of life they form painful fibrous nodules over the neck, back and shoulders, which mature into bone in a process known as heterotopic ossification. FOP progresses along the trunk and limbs, replacing healthy muscles with normal-appearing bone. Any attempt to remove the extra bone, however, results in explosive new bone formation. People who have FOP experience different rates of new bone formation; in some the progression is rapid, in others more gradual. Often, by their mid-20s, people who have FOP are immobilized by an extra skeleton of FOP bone and use a wheelchair full-time.

In 1987, then-29-year-old Jeannie Peeper had never known of anyone else with FOP. She asked her doctor at the National Institutes of Health, Michael A. Zasloff, MD, PhD, for the names of other patients so she could correspond with someone else who had FOP. She was given 18 names, the complete list of living FOP patients known to the NIH. Jeannie composed a questionnaire asking for each person's date of diagnosis, hobbies, interests and a few other details. With eleven responses, she began a newsletter, the FOP Connection. The next year, 1988, the International FOP Association was incorporated, and has since expanded to a membership of 300 in 42 countries. Members and supporters raise and donate funds which allow the IFOPA to fund research at a major university and support a small office staff.

continued on page 88

continued from page 87

The International FOP Association has three missions:

- supporting medical research to find treatments and a cure for FOP;
- educating physicians, patients and the public;
- providing support to patients and their families.

Medical Research

In 1991, Dr. Zasloff and orthopedic surgeon Dr. Frederick S. Kaplan founded the FOP Molecular Biology Laboratory at the University of Pennsylvania School of Medicine. Research conducted at the FOP Laboratory has yielded profound insights into bone formation and FOP; additionally, it may shed light on other bone-related conditions such as arthritis and osteoporosis. Funding sources include the National Institutes of Health, the Ian L. Cali Fund for FOP Research, the Stephen L. Roach/ Whitney Weldon Fund, and the International FOP Association. FOP patients from all over the world over travel to the University of Pennsylvania for clinical visits with Dr. Kaplan and his colleagues. Researchers can access the FOP community through the IFOPA, which offers a patient population needed for research.

Education

Rare disorders are often not recognized or correctly diagnosed, and it is not uncommon for people with FOP to be misdiagnosed and subjected to harmful surgery or chemotherapy. In 1985, for example, a prominent surgeon amputated the entire right arm and shoulder of a little girl whose condition he had misdiagnosed. The IFOPA works to disseminate information about FOP to doctors, patients, families, and the public.

A breakthrough came in February 1998 when an article about FOP, "A Few Hundred People Turned to Bone" by Thomas Maeder, appeared in The Atlantic Monthly. The next year, FOP was featured on television on ABC's 20/20 and in an hour-long segment, "The Skeleton Key", on the BBC's Horizons science program.

The Internet is a wonderful educational tool that has given anyone and everyone access to obscure medical information. Through the IFOPA website, http://www.ifopa.org, doctors can learn about FOP and patients can find each other. Parents of symptomatic but undiagnosed children have found information, which has led their doctors to a correct diagnosis of FOP.

Support

With a condition as rare and debilitating as FOP, patients and their families feel terribly isolated. IFOPA'a third mission is to provide support to FOP patients and their families. The group continues to publish FOP Connection, the quarterly newsletter begun in 1987, as well as an abbreviated newsletter, Milestones, directed to donors.

A private e-mail group, foponline, allows instant electronic access to the FOP community. A South American mother of a young child with FOP appealed to the e-mail group for guidance to help her child through a

With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler***.

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Please visit our Worldwide Web site at www.redbarn-enter.com for additional details and a video demonstration of the ***Creepster Crawler***.

painful flare-up, and community members responded with treatment suggestions and moral support. A 17-year-old wrote that she wants to move away from home to go to college and wondered how others schedule and pay for personal care attendants. Several FOP peers told how they find the accommodations and assistance they need to live on their own.

The IFOPA offers resources and consultation about assistive technology and funding sources through its L.I.F.E. Committee, Living Independently with Full Equality. IFOPA publications include What is FOP? A Guidebook for Families and What is FOP? Questions & Answers for the Children, both on the IFOPA website, and Overcoming Obstacles: A Catalogue of FOP Resources.

Three International FOP Symposia have been held in Philadelphia. The most recent, in 2000, was attended by 150 doctors and scientists and 94 persons with FOP and their families. For some it was a sweet reunion, while for others the Symposium provided their first opportunity to meet other people with FOP. Being together as a community feels like coming home. The bond of common experience and understanding is overwhelming. It's a glimpse of what heaven must be like, the place we are understood like nowhere else. EP

Third Annual World Congress

Thousands of individuals with disabilities, parents, caregivers, physicians and healthcare providers gathered at the Third Annual World Congress and Exposition on Disabilities in Orlando last month. They came to hear more than 200 sessions ranging from autism to adaptive sports to empowerment.

Keynote addresses from the Commandant of the U.S. Marine Corps, James L. Jones, himself the parent of a Fragile X daughter and Francis Collins, leader of the Genome Project were interspersed with formal and informal gatherings in every available area of the Orlando Convention Center.

The theme of the conclave was sounded by the head of the Department of Education's Special Education Division, Robert Pasternak. He said, "that the challenges and opportunities facing the disabilities community makes this an exciting time but one that requires much work and sacrifice. But in the end, we will have a brighter future."Also addressing the convention was Florida Governor Jeb Bush.

However, it was the attendees who provided the real motive power for the event, bringing their problems, answers and goals to every educational discussion. Many sessions featured overflowing crowds and spread out to adjoining rooms when the allotted time was over. As one healthcare professional from the Bahamas told a physician panelist, "I came here to learn and it will take me a year to digest all I have taken in."

Visitors to the sprawling exhibit area met a profusion of providers from large companies and individuals who were caregivers and saw a need that they could meet.

As Joseph M. Valenzano, Jr. said during one session; "two years ago I had a dream and today I am looking at a reality."

The Fourth World Congress on Disabilities will be held in Orlando, next September 18-20, 2003.

PART XIII

ORAL HEALTH: A VISION FOR THE FUTURE

by Clive Friedman, DDS

Beginning in 2001, *EP Magazine* has published a series of articles related to oral health. Specific articles have looked at topics including oral hygiene, the relationship of the mouth to the rest of the body, diseases of the soft tissue, orthodontics and managing behaviors. The question now asked is, where do we go from here?

Even within the United States and Canada, access to care continues to be a major problem for many individuals. Barriers to care include, finances, discrimination, prejudice; fear, anxiety, inability to articulate need and lack of perceived need, among other issues. Professional barriers include inadequate undergraduate education, insufficient staff training, failure to recognize diversity and the failure to see oral health in the context of illness and disability. Dr Sanford Fenton and Dr Carlton Horbelt articulate these problems extremely well in their October 2002 article. They explain the role the parent, guardian or direct support professional (DSP) can play in advocating for improved care by being V (vigilant) I (involved) and P (persistent). Experts also have to take on a greater responsibility in approaching this oral health issue. One of the biggest areas of need is in improving the undergraduate and postgraduate education of dental professionals and encouraging them to undertake this kind of care.

Dr Steven Perlman started the unique initiative of the Special Olympics Special Smiles Program, which has resulted in oral health screenings at more than 70 Special Olympics events across the US and at 12 international sites. These screenings have helped to identify the remarkable lack of care provided to only one segment of the special-needs population, and those who do not have access to Special Olympics would be even less likely to receive care. Special Olympics also helps to expose many health professionals who would otherwise never have that opportunity to people with disabilities.

Will we ever see a time when neither physical nor social discrimination is present and all persons with disabilities can access health care equitably? Perhaps this is an unanswerable question. But this article will articulate a vision of oral health in an attempt to alert readers to alternative possibilities with the need for improved access to total dental health care.

Health is a resource for living, not the object of living. It is a positive multidimensional and dynamic concept that can be described as the inclusion and balancing of an individual's social, emotional, spiritual and mental needs. Oral health is no less a dynamic concept without which overall health is not possible. Let's for one moment envision a situation where one is not fighting for basic access to care, but where instead it may be possible not only to access care but also to provide care that allows for the quality of life that everyone deserves, especially in one of the wealthiest countries of the world.

The oral cavity is composed of varying competing and complementary systems. Most dentists concentrate on the teeth, jaws and gums. Equally important are communication, swallowing, eating, breathing, and expression of emotions, all using various facial muscles. The anatomy of the oro-facial complex consists of small parts that should fit together in a cohesive unit, functioning in harmony and balance. Thus, problems in this area can occur with a malfunction in any of these systems. For example, a neurological impairment such as cerebral palsy, trauma or multiple sclerosis can affect anatomy, development, speech and nutrition. Neuromuscular impairments like muscular dystrophy or genetic conditions like Down syndrome or Prader-Willi syndrome will have a major impact on the oro-facial complex.

When taken in the greater context,

the need for evaluation and treatment of these systems together begins to make more sense. Thus an integrated approach to care is needed, where one can begin with an early diagnosis and initiate strategies for early intervention.

Let's look at a child with Down syndrome as an example. Prior to one year of age s/he could be evaluated with regard to muscle function and developmental growth patterns. Risk assessment for future problems should be evaluated. If muscular function was affecting speech development, therapy could be initiated to help speech development and tongue placement. Extra-oral massage could be initiated to simulate normal oral physiological development. Risk assessment evaluations for development of periodontal (gum and bone) disease as well as decay could be completed. Appropriate interceptive preventive programs could then start at an early age. This would require the coordinated and integrated efforts of a dentist, speech pathologist, occupational therapist, nutritionist, hygienist, physiotherapist and possibly a social worker. The presumption is that appropriate funding is available and that the agencies responsible are on board.

In most U.S. and Canadian systems of care, a person seeks treatment from each individual specialist as needed. Parents and caregivers will get information from each person and then must integrate all the information received on their own. Many times they receive contradictory information and have difficulty in determining whom to follow or believe. What if centers of excellence were established where an individual could receive a complete diagnosis of needs and establish treatment objectives for long-term care? Isolated areas where this team approach is taken are currently available; however, they exist largely within major university settings. For many parents the complexities of accessing this type of care are both burdensome and complicated.

Perhaps dentists and other professionals could begin to create centers where they could coalesce in groups and create this type of comprehensive care program. They may be forced to respond to this only when the recipient of care—using VIP—demands it.

The technological age has enabled parents and professionals alike to access information at the click of a mouse. Although much of this information may produce overload, it has at least made more possibilities available and creates a knowledgeable recipient who can advocate for care and will no longer accept mediocrity. This improved knowledge can empower those involved in the decision-making process including parents, guardians and DSPs who are part of the team. This will improve the overall care and quality of health of all involved.

Wouldn't it be nice if, just for once, a parent, guardian or DSP did not have to be an advocate in order to get care, did not need to be Vigilant, Involved and Persistent—if there were a system where it was easy to access quality care. In the realistic North American paradigm in which we live, this does not seem possible in the near future—but without the dream, the future evaporates.

Oral Health America has identified a 10-year campaign for improved oral health for 22.5 million Americans who currently do not have access to care. The definition of "disability" in the social context is: "...the loss or limitation of opportunities to take part in the normal life of the community on an equal level with others due to physical and social barriers." The future would provide every opportunity for individuals to participate in community life within the full spectrum of possibilities. Following the VIP principle, we want more than mediocrity and minimal care. Let's strive for excellence. The few dental professionals who treat persons with disabilities cannot do this alone – we need your help.

EP Magazine has begun this process by publishing numerous articles on oral health. Let's continue this momentum and remember that each single whisper eventually adds up to a scream. EP

Dr. Friedman is a pediatric dentist in private practice in London, Ontario, Canada. He is currently President of the IADH (International Association of Disability and Oral Health) and a Clinical Associate Professor at the University of Western Ontario.

THE SPECIAL NEEDS BOOKSTORE

AUTISM

THINKING IN PICTURES
My Life With Autism
TEMPLE GRANDIN WITH
A FOREWORD BY OLIVER SACKS

The author is a gifted animal scientist who has designed one third of all the livestock-handling facilities in the US. She is also autistic, a woman who thinks, feels, and experiences the world in ways that are incomprehensible to the rest of us. In this unprecedented book, the author delivers a report form the country of autism. Writing from the dual perspectives of a scientist and an autistic person, we learn how the country is experienced by its inhabitants and how she managed to breach its boundaries to function in the outside world. What emerges is a document that sheds light on the riddle of our common identity.

[illegible] $12.00

AUTISM IN THE EARLY YEARS
Resource Materials for Teachers: A Practical Guide
VAL CUMINE, JULIA LEACH
AND GILL STEVENSON

Designed to provide parents and professionals with an insight into the nature and educational implications of autism, particularly as it presents in very young children. Also aims to equip Early Years practitioners and parents with knowledge of a range of intervention strategies to promote learning, social development, communication and appropriate behavior.

NEW

TF5992AT $25.95

CREATING A "WIN-WIN IEP" FOR STUDENTS WITH AUTISM
A How-To Manual for Parents and Educators
BETH FOUSE, PH.D.

This Second Edition, has been written to provide parents and families of students with autism necessary information and skills to meet the challenges of the IEP process. This book takes readers through the child-centered educational process from the stages of initial diagnosis to implementation ad of student's individualized educational programs. Practical suggestions are provided based on federal and state legislative requirements, case law, and the many years of experience the author has in working with the process as a teacher, special education administrator, regional special education consultant and university instructor.

NEW

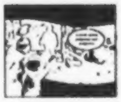
FH7287SE $29.95

A User Guide to the GF/CF Diet for Autism, Asperger Syndrome and AD/HD
LUKE JACKSON; WITH
APPENDICES BY JACQUI JACKSON;
FOREWORD BY MARILYN LE BRETON

Luke Jackson, who is 12 years old and has Asperger Syndrome, tells you everything you need to know, both good and bad. He offers encouragement and practical advice on what to expect when beginning the gluten and casein free diet, how to alleviate any initial discomfort, and how to live with the diet.

NEW

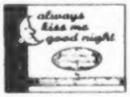
TF0551AS Cost: $17.95



IF THE WORLD WERE BLIND
A Book About Judgement And Prejudice
KAREN GEDIG BURNETT WITH
ILLUSTRATIONS BY LAURIE BARROWS

This fascinatingly unique children's story is relevant to everyone, not just the children it is written for. You will find yourself asking how you view people, and what if, you couldn't view them at all?

CRP3040VI $17.95



ALWAYS KISS ME GOODNIGHT
Instructions on raising the perfect parent
COMPILED BY J. S. SALT

Instructions on raising the perfect parent as seen in the eyes of 147 children. One of the most popular, entertaining, and insightful books a parent will ever find.

RH1090D $7.00

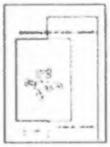
EDUCATION

EFFECTIVE COMMUNICATION
Collaborative Practices For Educators
Strategies for Effective Communication
PATTY LEE, ED.D.

This new revised edition includes 60 strategies and 180 practice activities designed to improve communication and collaboration skills. The activities may be used in any order allowing you and your colleagues to focus on one specific area or work in several areas simultaneously! Covers six (6) critical areas: Developing Expectations; Preparing Ahead; Understanding Perspectives; Listening; Asking Questions and Speaking Clearly.

NEW

PP5261ED $19.95

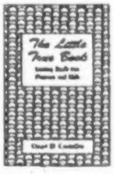


COOPERATIVE LEARNING AND STRATEGIES FOR INCLUSION
Celebrating Diversity In the Classroom
JO ANNE W. PUTNAM

This guide shows educators how to make group learning strategies work in their classrooms. There are chapters written by a distinguished array of professionals who reveal the real educational benefit of a cooperative learning environment.

PB167ED $26.95

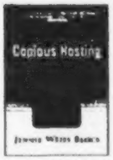
RELIGION



THE LITTLE TRUTH BOOK
Loving Truth for Parents and Kids
ROGER D. CASTERLINE

Do you want a friend for keeps, a real friend? Well Roger D. Casterline will help you get acquainted with one, and his name is Jesus. This book is about relationships, not religion, and if you think you already know Jesus, you can still get to know him even better with the help of this book.

VA9031PA PRICE: $8.95



COPIOUS HOSTING
A Theology of Access for People with Disabilities
JENNIE WEISS BLOCK

This book smartly explores disability and theology in wonderfully contemporary terms. The author confesses not to speak for people with disabilities, yet masterfully examines the breadth and depth of the diverse disability community, and relates this body of knowledge to sometimes conservative theological tenets.

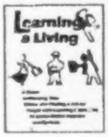
CI3498RE PRICE: $19.95

LEARNING DISABILITIES

EINSTEIN AND ME: TALKING ABOUT LEARNING DISABILITIES
A Video for Parents, Kids & Teachers
JEROME J. SCHULTZ, PH.D.

An upbeat, informative and optimistic video of kids talking openly and honestly, telling about how they found out about their learning disability, policies and people who make life difficult; people and programs that helped them cope; their strengths and talents.

LD100LD $99.00



LEARNING A LIVING
A Guide to Planning Your Career and Finding a Job for People With Learning Disabilities, ADD, and Dyslexia
DALE S. BROWN

A veritable cornucopia of information and tips about the impact of learning disabilities, feedback from others, useful mentor relationships, among other things. Whatever your career interests, this book will help you become successful in realizing your goals.

WB9875LD $18.95

THE EXPERTS SPEAK
Parenting the Child With Learning Disabilities
TERESA A. CITRO

A clear, comprehensive, and direct collection of writings by professionals in the field of learning disabilities in their area of concentration. Whether it is teaching, parenting, or socialization there are stories on it here.

LD200LD (English) $18.99
LD7129LD (Spanish) $18.99

MENTAL RETARDATION

THE BURDEN OF SYMPATHY
How Families Cope with Mental Illness
DAVID A. KARP

This book captures the essence of caring and caregiving for society today. It carefully discusses the emotional and social forces that are at play when caring for a mentally ill person.

NEW

OU3158MR $25.00

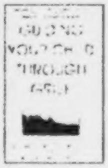
MENTAL RETARDATION IN THE 21ST CENTURY
SPONSORED BY THE ARC OF THE UNITED STATES, EDITED BY: MICHAEL L. WEHMEYER AND JAMES R. PATTON

An interesting and provocative prediction of where technology and society are headed with respect to the treatment of mental retardation in the coming century. Seven Sections covering Family Issues; Education Issues; Employment and Residential Issues; Psychology Issues; Medicine and Health Issues; Life Span Issues and Policy Issues.

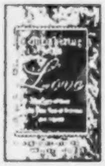
[illegible] $ 44.00

GRIEVING

What on Earth Do You Do When Someone Dies
Trevor Romain
A down to earth explanation for children about death. It offers many ways for children to cope with and understand what is happening.
FS400DE **$7.95**



Guiding Your Child Through Grief
Mary Ann Enswiler, MA, MRS, and James P. Enswiler, MA, M.Ed
This caring and compassionate guide offers expert advice during the . difficult days to help a child grieve the death of a parent or sibling. This book helps readers understand the many secret ways children grieve and offers more insight information, and advice that can help a child heal.
BD0257GR **$13.95**

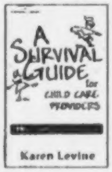


Remembering With Love
Messages of Hope for the First Year of Grieving and Beyond
Elizabeth Levang, PhD. and Sherokee Ilse
An affirming gift for those grieving the loss of a loved one, offering compassion, comfort and guidance with over three hundred short pieces written bv those who have been there.
FP0400E **$11.95**

FOR YOUNG PEOPLE

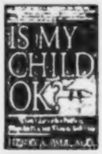
Why Am I Different?
Norma Simon with pictures by Dora Leder
This cute story tackles the idea of difference among children in every way except that of disability. That in itself makes the idea of difference easier to understand, accept, and overcome for any child, especially those that may feel more different that any other child.
AW0746YP **$13.95**

GENERAL



A Survival Guide for Child Care Providers
Tips From the Trenches
Karen Levine
This purposeful book of tips, reflections, and quotes is based upon anecdotal observations of educators with years of resourceful experiences to share with others in the teaching proffession. Serving as a focus for the book are Seven Guiding Principles that are oriented toward early childhood education.
CH0013EN **$13.95**

Neuroimaging
A Window To The Neurological Foundations of Learning and Behavior in Children
G. Reid Lyon, Judith M. Rumsey
Explores the application of anatomical and functional neuroimaging techniques and procedures to the understanding of specific medical conditions and developmental disabilities in children. Includes two chapters covering the basic biological and methodological concepts needed to understand neuroimaging procedures.
PB2568M **$49.95**



Is My Child OK?
When Behavior Is A Problem, When It's Not, and When to Seek Help
Henry A. Paul, MD
Every parent has asked this question at one time or another. This wise and compassionate guide offers reassuring words for worried parents as well as concrete ways to spot problems between a normal stage of development…and a true problem. This one step reference book tells parents what is normal, what is not, and where to get help.

familiar faces

PATRICK

JOSIAH

Patrick H. Gregg,15, and younger brother **Josiah Raymond Gregg**, 6, were both born with a rare genetic disorder called Neonatal Adrenaleukodystrophy. Patrick is blind, partially deaf and is severely and profoundly developmentally delayed. Josiah has a trache and had a liver transplant and partial bone marrow transplant when he was two years old. Patrick enjoys swimming and Josiah loves horses and enters a yearly reading contest that is sponsored by the Congress Library for the Blind. Their parents, Ron and Deenna Gregg of Clinton, Iowa, love them both very much.

AUSTIN

Austin Jeremiah Scudder is 22 months old and has Cerebral Palsy. Austin is a happy little boy who loves his parents and enjoys Elmo, Baby Einstine videos, and swimming at the YMCA. His grandmother Joy says that he's a sweet, loveable and sassy child, and a "gift to our family."

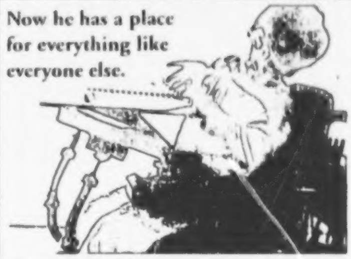
LILY

Lilly Isabella Lutterman, 2, is "a blessing," according to her mother Debbie. She was diagnosed at birth with Down syndrome, had heart surgery at four months and had a pacemaker put in ten days later. Now she is able to walk part-time, and has made life complete for the rest of her family, including her parents Bill and Debbie as well as her five siblings.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (EXCEPTIONAL PARENT), 65 E. Route 4, River Edge, NJ 07661. (Please do not send "one-of-a-kinds" as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

PRODUCT SHOWCASE

Product Showcase is a special service for EXCEPTIONAL PARENT readers. You can shop for the quality products and services shown here right from the convenience of your own home, or request more information from Product Showcase advertisers simply by circling the appropriate numbers on the postage-paid reader service card bound in this issue. The information you request will soon be delivered directly to your home.



Now he has a place for everything like everyone else.

It's unique ball-joint movements and sturdy support put MYDESC in a class of its own. It tilts for reading, writing or computing, then goes flat for lunch time and breaks. A secret storage compartment hides papers, books, and pencils. And when it's time for transfers, the entire desktop swings down to the side.

"My Hero"

by Nicole Goldstein

I have a brother with Down syndrome. He teaches me things like to be patient and take your time. He also teaches me to be happy with what I have and with who I am. Sometimes the most unlikely people can teach you the most important lessons in life.

His name is Jonah but everyone calls him JJ and he's six years old. JJ's the one that taught me all about Down syndrome by the way I watch him grow, learn new things and act. My brother is one of the cutest six-year-olds I have ever seen. He's a model and was in a commercial and two magazines for Toys R Us.

My friends never have a problem with the fact that I have a brother with Down syndrome. They think JJ is extremely cute and funny. He runs, jumps and plays like any other six-year-olds around. JJ takes gymnastic lessons and he's very good at it. He can do a cartwheel and even a handstand.

I once went to a program in JJ's school with my family. We met his teachers and friends. There we learned sign language because when JJ was younger and he couldn't talk he used sign language to tell us what he wanted. That was a fun day!

I worry so much about JJ and always look out for him. One time he got lost in a hotel in the Bahamas. JJ and I woke up early one morning when everyone was asleep. Without noticing JJ walked out of the hotel room. He decided to take a little ride on the elevator. He rode all the way up to the fifteenth floor. A family found JJ in the elevator alone on their way down to breakfast. They called security and we couldn't find him for at least an hour. It scared me so much because I love him.

I have some advice for brothers and sisters with siblings with special needs. I was five years old when JJ was born. Before I knew what Down syndrome was I told my mother that I wished I had Down syndrome because JJ was getting a lot of attention. My mother told me that he gets a lot of attention because he learns a lot from everyone around him and I want to help him. As I got older I understood that my parents love me just as much as they love JJ and I don't need the same kind of attention that he does.

JJ and Nicole Goldstein

I want to say how much I love JJ and I love him just the way he is. But I hope that one day he will be able to talk better and I know that he will because he's very smart and there are so many people to help him get there. No matter what, JJ is my hero. EP

Submit your Children's Page to: EP, ATTN: CHILDREN'S PAGE, 65 East Route 4, River Edge, NJ 07661. Be sure to include your name, address, daytime telephone number and e-mail address! ***Now on the Web!*** We now include **Familiar Faces** and **Children's Page** on our Web site, http://www.eparent.com. Please send us your photographs with the understanding that doing so gives EP permission to put the photos on the EP Web site, exactly as they appear in the magazine and with the same text.

"in my mind, i cannot hide my joy."

What makes a happy person happy? Is it the capacity to learn, love, laugh? The gift to embrace life? Is it a sense of purpose? To be part of the solution, not the problem? Or perhaps the ability to take great joy in giving and demonstrate even greater humility in receiving? At Kennedy Krieger, we believe it is all this and more. We care for and treat children with developmental disorders such as cerebral palsy, autism, Down syndrome, and others. Working together, we give each other a great sense of purpose and a daily reason to smile. We learn as much from our young patients and students as they learn from us and we are inspired by their courage. In return, we dedicate ourselves to helping and healing them, so that each child may experience the full joy of life. And that, makes us all very happy.

Every child is born with great potential. Shouldn't every child have the chance to achieve it?

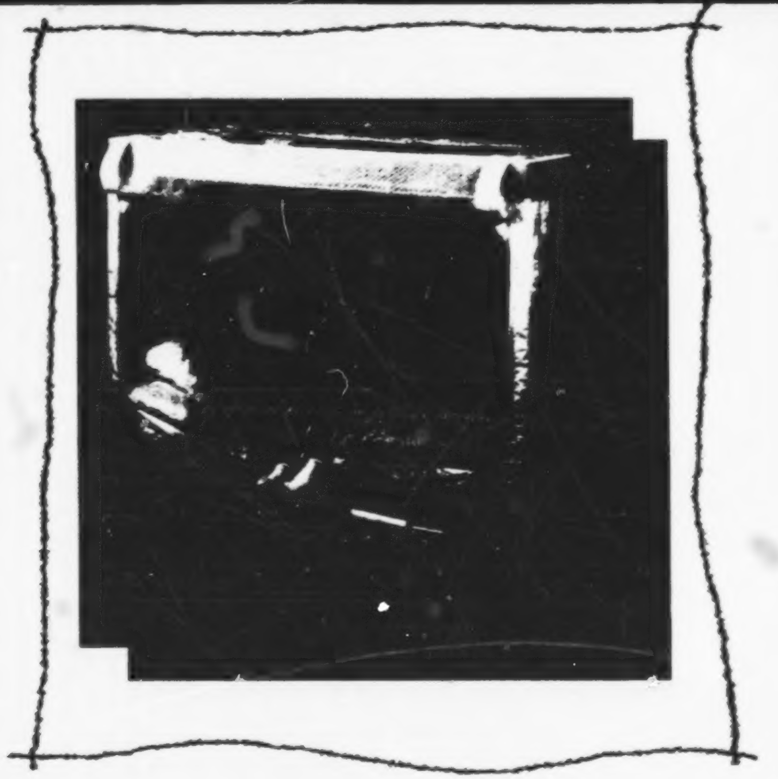
A Better Bedtime Story

The Vail Enclosed Bed



Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt. Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

We do our best to make extraordinary moments completely ordinary.

Everyone should enjoy their independence. Including those with disabilities. That's why, year after year, GM® Mobility is working hard to offer new ideas and innovations… designed to lower barriers and enhance personal freedom.

This is done with help from a select team of GM designers and engineers — many who have disabilities of their own — who bring their unique insights to our products. The result is a lineup of vehicles that offer easy accessibility and visibility. Features pre-designed to simplify modifications. As well as the available security of OnStar on most GM vehicles.

To help get you on your way, we offer a complete instructional packet filled with valuable information, from upfitting to financing. To get yours, just call the GM Mobility Assistance Center at 1-800-323-9935. TTY users, call 1-800-833-9935. Or visit us online at gmmobility.com.

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

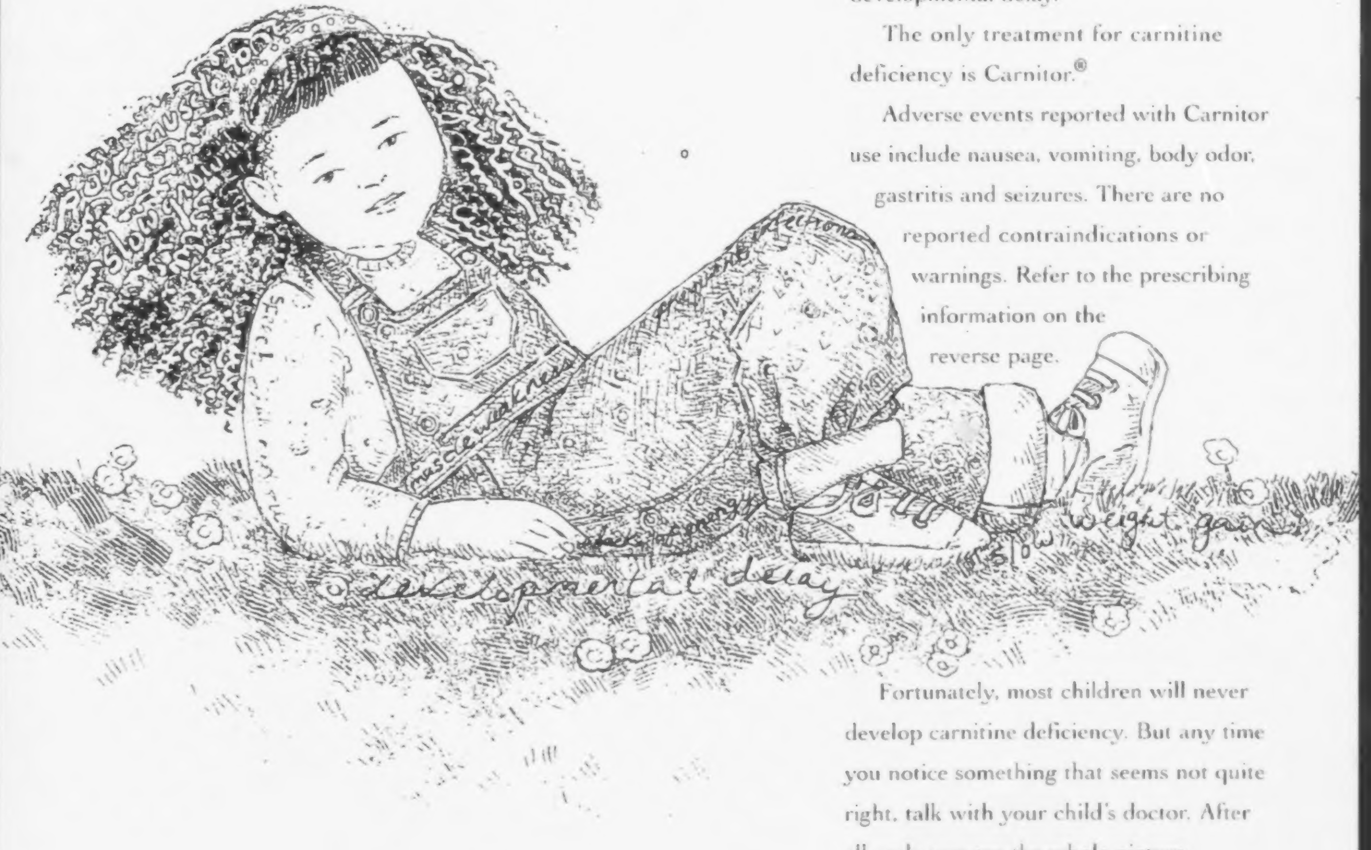
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

©2000 Sigma-Tau Pharmaceuticals, Inc. All rights reserved. PA-10

Circle #44 or visit www.eparent.com/adinfo

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

Quality for life

The Bugsy walker's maximum adjustability and solid, lightweight construction provide safety, convenience, and functionality like no other.

The Bugsy's highly adjustable design encourages active postural control during standing and walking, while also promoting a more natural movement. Unlike other walkers, Bugsy's solid rubber wheels feature stainless steel ball bearings for smooth, easy maneuverability. The anti-reverse wheel design prevents inadvertent backward rolling for safety. Lightweight construction and a quick fold-up feature provide easy handling and storing.

Contact your Otto Bock Sales Representative (U.S. 1-800-328-4058 or Canada 1-800-665-3327) to see the Bugsy pediatric postural walker firsthand.

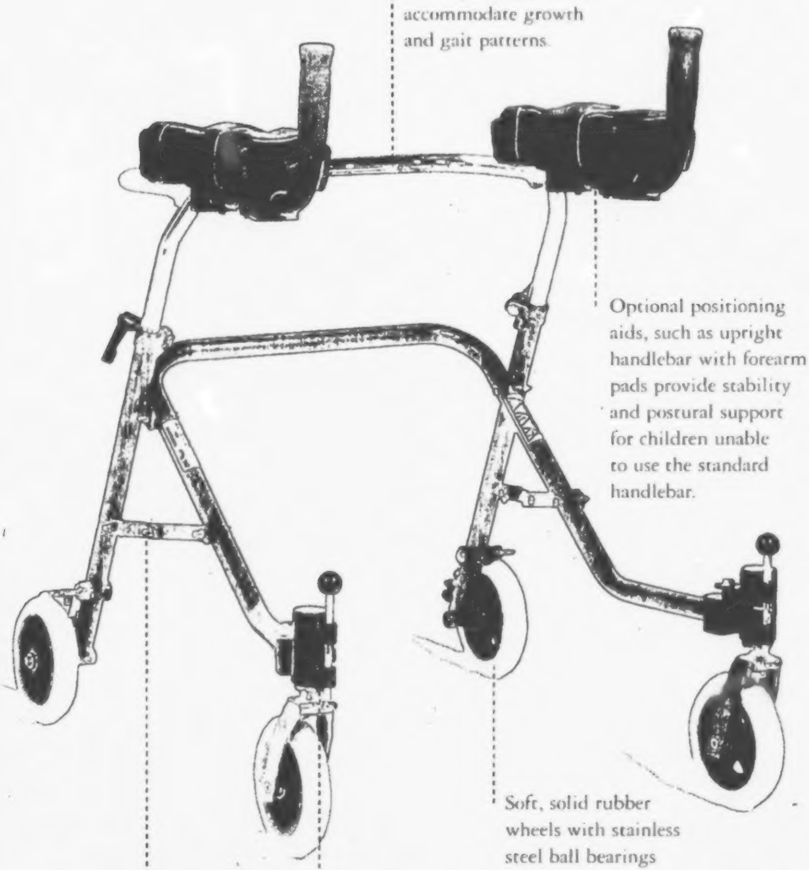
CONTROL



Handlebars are height and depth adjustable to accommodate growth and gait patterns.

Optional positioning aids, such as upright handlebar with forearm pads provide stability and postural support for children unable to use the standard handlebar.

Lightweight and easily folded for added convenience.

Optional swivel wheel locks and rear friction brakes provide directional control and extra safety.

Soft, solid rubber wheels with stainless steel ball bearings provide easy rolling and maneuverability even under heavy pressure.

Optional hip pads and seat

Optional back support and handle grips with wooden stops

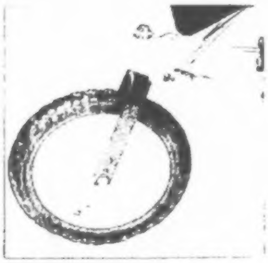
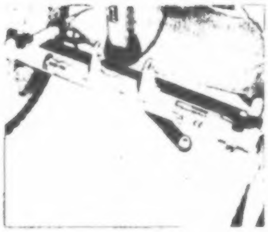
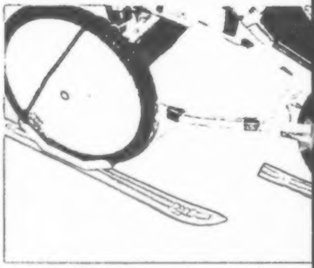
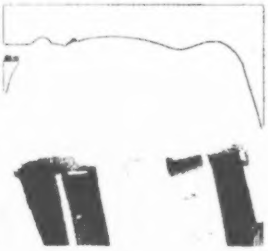
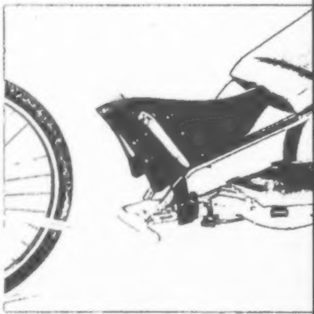
The KANGOO











Imagine a product that lets you jog with your child through a park, take her for a bicycle ride through your neighborhood, or let him experience the joys of cross country skiing...You've just purchased a Kangoo, the only mobility base that provides these opportunities. The Kangoo allows your child to experience the outdoors like no other product.

The Kangoo easily folds to fit into the trunk of your car or store in the closet. Made from high-grade aluminum, it is light enough for anyone to handle, and durable enough to provide many years of use. A high quality shock absorber provides optimum comfort for your child even when traveling over the roughest of terrains, and the high quality wheels and axles require minimal effort to push the Kangoo.

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

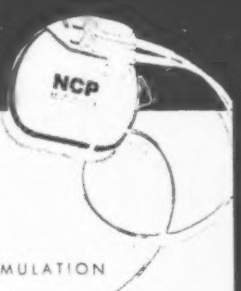
So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

BEST COPY AVAILABLE



VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

VNS THERAPY

VAGUS NERVE STIMULATION

Cyberonics

Circle #25 or visit www.eparent.com/adinfo

EXECUTIVE SUMMARY[1]
SAFETY INFORMATION
FOR THE NCP® SYSTEM

INTENDED USE / INDICATIONS – UNITED STATES

The NCP System is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications.

CONTRAINDICATIONS

- The NCP System cannot be used in patients after a bilateral or left cervical vagotomy.
- Do not use short-wave diathermy, microwave diathermy, or therapeutic ultrasound diathermy on patients implanted with the NCP System. Diagnostic ultrasound is not included in this contraindication.

WARNINGS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals. This is not intended to serve as a substitute for the complete NCP System Physician's Manual.

⚠ The **safety and efficacy** of the NCP System has not been established for uses not covered in the "Intended Use/ Indications" section of the manual.

⚠ The safety and efficacy of the NCP System treatment has not been established for stimulation of the **right vagus nerve** or of any other nerve, muscle, or tissue.

⚠ **Excessive stimulation** at a combination of high frequency (≥ 50 Hz) and an excess duty cycle (that is, one that occurs when ON time is greater than OFF time) has resulted in degenerative nerve damage in laboratory animals. An excess duty cycle can be produced by continuous or frequent magnet activation (> 8 hours), as determined by animal studies. Cyberonics recommends against stimulation at these combinations of ranges.

⚠ **Aspiration** may result from the increased swallowing difficulties reported by some patients during stimulation. Patients who have **pre-existing swallowing difficulties** are at greater risk for aspiration.

⚠ **Device malfunction** could cause painful stimulation or direct current stimulation. Either event could cause nerve damage and other associated problems. Patients should be instructed to use the magnet to stop stimulation if they suspect a malfunction, and then to contact their physician immediately for further evaluation. Prompt surgical intervention may be required if a malfunction occurs.

⚠ Susceptible patients with predisposed cardiac conduction systems (re-entry pathway) have not been studied as part of controlled clinical trials to establish the safety of NCP system treatment in these patients. Evaluation by a cardiologist is recommended if the family history, patient history, or electrocardiogram suggests an abnormal cardiac conduction pathway. Serum electrolytes, magnesium, and calcium should be documented before implantation. Post-implant electrocardiograms and Holter monitoring are recommended if clinically indicated.

⚠ **Sudden unexplained death in epilepsy (SUDEP):** Through August 1996, 10 sudden and unexplained deaths (definite, probable, and possible) were recorded among the 1,000 patients implanted and treated with the NCP device. During this period, these patients had accumulated 2,017 patient-years of exposure. Some of these deaths could represent seizure-related deaths in which the seizure was not observed, at night, for example. This number represents an incidence of 5.0 definite, probable, and possible SUDEP deaths per 1,000 patient-years. Although this rate exceeds that expected in a healthy (nonepileptic) population matched for age and sex, it is within the range of estimates for epilepsy patients not receiving vagus nerve stimulation, ranging from 1.3 SUDEP deaths for the general population of patients with epilepsy, to 3.5 (for definite and probable) for a recently studied antiepileptic drug (AED) clinical trial population similar to the NCP System clinical cohort, to 9.3 for patients with partial onset epilepsy.

⚠ **The NCP device is not curative:** Physicians should warn patients that the NCP System is not a cure for epilepsy and that since seizures may occur unexpectedly, patients should consult with a physician before engaging in un-supervised activities, such as driving, swimming, and bathing, and in strenuous sports that could harm them or others.

⚠ **Obstructive Sleep Apnea:** Patients with obstructive sleep apnea (OSA) may have increased apneic events during stimulation. Cyberonics recommends care when treating patients with preexisting OSA. Lowering stimulus frequency or prolonging OFF time may prevent exacerbation of OSA.

PRECAUTIONS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals.

⚠ **Laryngeal irritation** may result from stimulation. **Patients who smoke** may have an increased risk of laryngeal irritation.

⚠ **Dyspnea** may result from stimulation. **Patients with chronic obstructive pulmonary disease** may have an increased risk of dyspnea.

⚠ It is important to follow **recommended implantation procedures and intraoperative product testing** described in this manual. During the intraoperative Lead Test, rare incidents of bradycardia and/or asystole have occurred. As of October 1998, approximately 3,000 patients had been implanted with the NCP System. Four of these patients were reported to have experienced **bradycardia and/or asystole** during the intraoperative Lead Test. All four patients recovered without sequelae. One of the four patients was implanted with the NCP System. There were no postoperative or VNS-treatment-related cardiac adverse events later reported for that patient. No similar events were reported to have occurred during the clinical studies at the time of implantation or during treatment. The safety of this therapy has not been systematically established for patients experiencing bradycardia or asystole during NCP System implantation.

⚠ **Reversal of lead polarity has been associated with an increased chance of bradycardia** in animal studies. It is important to make sure that the Lead connector pins are correctly inserted (white marker to + connection) into the Pulse Generator header.

⚠ It is important to follow **infection control procedures**. Infections related to any implanted device are difficult to treat and may require that the device be explanted. Cyberonics recommends that the patient be given antibiotics preoperatively. The surgeon should ensure that all instruments, including the NCP Tunneling Tool, are sterile prior to the operation.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve** in the neck area inside the carotid sheath.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve below where the superior and inferior cervical cardiac branches separate from the vagus nerve.**

⚠ A **neck brace** can be used by the patient for the first week to help ensure proper Bipolar Lead stabilization.

Environmental and Medical Therapy Hazards

⚠ Patients should exercise reasonable caution in avoiding devices that generate a **strong electric or magnetic field.** (For examples, see the "Other Environmental Hazards" section of the Physician's Manual.) If a Pulse Generator ceases operation while in the presence of electromagnetic interference (EMI), moving away from the source may allow it to return to its normal mode of operation.

⚠ NCP System operation **should always be checked** by performing device diagnostics after any of the procedures mentioned in the Physician's Manual.

⚠ Because of where the Pulse Generator is implanted in the chest, **patients may need to be specially positioned in mammography equipment for clear imaging.** Otherwise, the device may be seen as a shadow on the mammogram. (Most routine diagnostic procedures, such as fluoroscopy and x-radiography, are not expected to affect system operation.)

⚠ **Therapeutic radiation** may damage the Pulse Generator's circuitry, although no testing ha been done to date and no definite information on radiation effects is available. Sources of such radiation include therapeutic x-rays, cobalt machines, and linear accelerators. The radiation effect is cumulative, with the total dosage determining the extent of damage. The effects of exposure to such radiation can range from a temporary disturbance to permanent damage, and may not be detectable immediately.

⚠ **External defibrillation** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for external defibrillation.

⚠ **Electrocautery surgery** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for electrocautery surgery.

⚠ **Magnetic resonance imaging** (MRI) should not be performed with a magnetic resonance body coil in the transmit mode. The heat induced in the Bipolar Lead by an MRI body scan can cause injury.

Use caution when other MRI systems are used, since adverse events may occur because o different magnetic field distributions.

⚠ No scan in which the radiofrequency (RF) is transmitted by the body coil should be done on a patient who has the NCP System. Thus, protocols must not be used which utilize local coils that are RF-receive only, with RF-transmit performed by the body coil. Note that some RF head coils are receive only, and that most other local coils, such as knee and spinal coils, are also RF-receive only. **These coils must not be used in patients with the NCP System.**

⚠ **Therapeutic ultrasound.** Routine therapeutic ultrasound could damage the Pulse Generator and may be inadvertently concentrated by the device, causing harm to the patient.

⚠ **Extracorporeal shockwave lithotripsy** may damage the Pulse Generator. If therapeutic ultrasound therapy is required, avoid positioning the Pulse Generator part of the body in the water bath or in any other position that would expose it to ultrasound therapy. If that positioning cannot be avoided, program the Pulse Generator output to 0 mA for the treatment, and then after therapy, reprogram the Pulse Generator to the original parameters.

Diagnostic ultrasound is not expected to affect the NCP System.

⚠ The Pulse Generator may affect the operation of **other implanted devices,** such as cardia pacemakers and implantable defibrillators. Possible effects include sensing problems and inappropriate Pulse Generator responses. If the Pulse Generator patient requires concurrent implantable pacemaker and/or defibrillator therapy, careful programming of eac system is necessary to optimize the patient's benefit from each device.

ADVERSE EVENTS

Adverse events reported during clinical studies as statistically significant are listed in alphabetical order Ataxia (muscle movements or twitching, generally associated with stimulation); Dyspepsia (indigestion); Dyspnea (difficulty breathing, shortness of breath); Hypesthesia (impaired sense of touch); Increased coughing; Infection; Insomnia (inability to sleep); Laryngismus (throat, larnx spasms); Nausea; Pain; Paresthesia (prickling of the skin); Pharyngitis (inflammation of the pharyn throat); Voice alteration (hoarseness);Vomiting.

Other potential adverse events possibly associated with surgery or stimulation include but are no limited to the following:

Aspiration (fluid in the lungs); Blood clotting; Choking sensation; Damage to nerves or vasculature i the surgical area, including the carotid artery and jugular vein; Device (Generator and/or Lead) migration or extrusion; Dizziness; Dysphagia (difficulty swallowing); Duodenal ulcer, gastric ulcer; Ear pain; Facial flushing; Facial paralysis, paresis; Foreign body reaction to implants, including possible tumor formation; Formation of fibrous tissue, pockets of fluid; Heart rate and rhythm changes; Hiccuping; Incision site pain; Irritability; Laryngeal irritation (sore, painful throat); Left hemidiaphragm paralysis; Left recurrent laryngeal nerve injury; Left vocal cord paralysis; Low-grade fever; Muscle pain; Neck pain; Nerve injury; Painful or irregular stimulation; Skin, tissue reaction; Stomach discomfort; Tinnitus (ringing in the ears); Tooth pain; Unusual scarring at the incision site; Urinary retention; Vagus nerve paralysis; Weight change; Worsening of asthma and bronchitis; Worsening of cardiac abnormalities, including heart rate and rhythm.

⚠ Patients who manipulate the Pulse Generator and Bipolar Lead through the skin may damag or disconnect the Bipolar Lead from the Pulse Generator and/or possibly cause damage to th vagus nerve.

A LEGLESS REPORT GIVES BIRTH TO A NEW ACADEMY

In February of 2002, Surgeon General David Satcher released his Report of the Surgeon General's Conference on Health Disparities and Mental Retardation. In the foreword to his report, Dr. Satcher states, "It became apparent that, as our system of care for those with mental retardation evolved, our attention to their health needs lessened."

The Surgeon General's Report directs those of us who care for persons with developmental disabilities toward six strategic goals which will "close the gap" in the delivery of health care to this population of Americans. Page nine of Dr. Satcher's National Blueprint, Goal 4: Train Health Care Providers in the Care of Adults and Children with Mental Retardation, addresses the lack of professional training in the care of persons with developmental disabilities.

Dr. Satcher observes, "The challenges and rewards of treating individuals with MR are rarely addressed in the training of physicians and other health care professionals. However, anecdotal evidence and limited data indicate that opportunities for clinical ezperiences with these patients, early in medicla and other health professions training, increase the capacity of providers to value and accept these patients into their practices."

Candidly Dr. Satcher has often expressed his dismay (and the reality) that the Reports of the Surgeon General "don't have legs" and unless motivated and committed individuals translate the reports into action, the reports will frankly remain interesting artifacts.

But how do you translate the need to train the next generation of physicians and dentists to care for people with disabilities into innovative curriculums, clinical opportunities and rewarding careers? You congeal a group of like minded rogues on which someone says, "Who wants to be the president?" after realizing that everyone has dropped the ball (or never thought of picking it up).

Exceptional Parent magazine takes great pleasure in announcing the establishment of The American Academy of Developmental Medicine and Dentistry.

The academy's president is Dr. Phil May, Clinical Associate Professor of Medicine at the Robert Wood Johnson Medical School and Chief of Medicine at the Hunterdon Developmental Center (Clifton, New Jersey). Phil has been a pioneer in the creation of medical undergraduate and postgraduate programs in neurodevelopmental disorders.

By chance at the Surgeon General's Conference Phil met his dental counterpart Dr. Henry Hood. Henry is a Clinical Assistant Professor at the University of Louisville School of Dentistry and the head of the Dental Clinic at the Hazelwood Center in Louisville. Like Phil, Henry has long seen the need to introduce students to the joys of making a difference in the lives of individuals with special healthcare needs.

Henry, the Academy's new Executive Director met Phil again at the Chicago meeting of Special Care Dentistry. Phil was one of five "physicians" invited to participate in a presentation on "Physician - Dentist Collaboration" (they do after all work on the same body). This novel meeting (the brainchild of Special Care Dentistry President Dr. Paul Glassman) of physicians and dentists involved in specialized health care must have initiated some major brain flossing cause things have never been the same to these pioneers.

Catalyzed by developmental psychiatrist Dr. Steven Zelenski of the University of Wisconsin's Weisman Institute, (so let's see we got the body, mouth and mind covered so far) the proposal to incubate the American Academy of Developmental Medicine and Dentistry was formalized on May 15th, 2002.

Dr. May, in describing the Academy's (AADMD) National Action Strategy aimed at giving the Surgeon General's Report some legs offered, "We believe part of the solution to the problem can be found by promoting collaborations between physicians and dentists in the community, between medical schools and dental schools, and between Human Services programs, which currently exist in institutions, with those in the community."

Working in parallel with the new Academy was Dr. Steve Perlman (a member of the EP Dental Advisory Board) who's work with the Special Olympics "Healthy Athletes" initiative led to compelling Senate hearings which served as the footprints to the Surgeon General's Report. If Steve led the footprints then it surely was Dr. Sandy Fenton (Chair of the Community Dentistry Program at the University of Tennessee's School of Dentistry) who provided the hoofbeats with his successful championing of the cause of oral health for people with disabilities with the American Dental Association.

Pioneers, rogues, visionaries...the stuff of a new Academy, an Academy born out of a report that cried out for legs.

Membership is open to physicians, dentists, allied health professionals and persons interested in the promotion of improved healthcare to people with neurodevelopmental disabilities. EP

Search & Respond

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: EP Magazines, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S

Adaptable Socks

My ten-year-old with Down Syndrome has especially poor, fine motor skills and is unable to dress himself. With the right socks, however, he might be able to pull on his own socks. They must be tube socks with no heel, and stretch easily so he can make them very wide, and should be ankle length. Perhaps stretchy terry material would work. I'd be interested in any leads on how to find such socks.

—LM via EP Web Site

S

School Bus Schedule Problems

I have a 16-year-old daughter who is diagnosed as having severe retardation, epilepsy, and mild cerebral palsy. She currently attends a special education classroom in another school district and is now being picked up from school a half hour after school lets out and she gets home from school an hour later. The school she attends is only 15 minutes away from home, but her wheelchair bus, after picking her up, is then picking up other kids from other schools. The district says she can be kept on the bus for up to 90 minutes. She is exhausted and lethargic when she gets home, but school officials tell me 90 minutes is a reasonable time and they will not consider changing the bus route. Has anyone had this problem and solved it?

—NM via EP Web Site

S

Problems with Toilet Training

Our seven-year-old grand daughter has athetoid cerebral palsy. She is a very bright child, understands everything and has just started using the Dynavox to communicate. She is in school and they are talking of mainstreaming her next year. My problem is toilet training. We have been working on it for about two years now. At first she would point if she needed to potty, then we got a little recorder to strap to her leg so she could tell us, but she now only does it so inconsistently. If we take her every hour or so she will usually do real well without any accidents, but if we leave it to her to inform us when she needs to go, she seldom tells us. I was wondering if anyone out there had a similar situation or had any suggestions on toilet training.

—F via EP Web Site

S

Lip Biting

We have a three-year-old daughter with CP who has a habit of biting her lower lip. She was recently sent home from school because she bit herself pretty bad and her teachers and therapist said that they have never seen that before. Has anyone out there overcome a similar situation?

—RP via EP Web Site

S

Double Strollers

Hi, I am the mother of two girls with an unknown genetic disorder. They are two and thirteen. Both have multiple disabilities such as seizures, cataracts, gastroesophogeal reflux, and low muscle tone. Neither one can sit unsupported, walk or talk, and both need a lot of special attention. I am currently looking for any information on a double stroller for the two of them. I need to be able to get them to the doctor and therapy sessions and I do not always have someone available to help. The stroller needs at be able to accommodate a toddler and a young teen. If anyone knows of one out there that would work, please let me know.

HARD MANUFACTURING

AGE APPROPRIATE
BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas

The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

bral palsy. He is an independent walker physically, but does not understand any safety issues, so his parents have to hold his hand all the time or use a stroller. When his mom holds his hand he is always trying to pull away or go in a different direction than she is. This is very hard on her back and she would like to know if anyone has ideas for a harness-type tether system that would keep him safely connected to her but she wouldn't have to hold his hand. We are also concerned that the system does not cause him to trip or get pulled off balance.

—SL via EP Web Site

Reading Problems with CP

My son is 11 years old and has a diagnosis of cerebral palsy and more recently, autistic spectrum disorder with regard to sensory processing. My son has great memory capability but cannot focus in order to read or write. Not one program in either the various school or non-school settings have been successful to help him learn to read. He can only recognize site words occasionally — it seems to be intermittent, not on a regular basis. We have had him tested just about everywhere and all come up with same diagnosis but no suggestions to help him learn to read. I would appreciate hearing from other families regarding what programs they have found to be successful with any children with similar-diagnoses. Can anyone help us? Thank you.

—LP via EP Web Site

Respond

Lattice Corneal Dystrophy

DE has a five-year-old grandson with Lattice Corneal Dystrophy, and is looking for further information or support regarding this condition.

We have a nearly six-year-old grandson with the same diagnosis. As I'm writing this note, we are in a dark room so he can play. He's enrolled in Kindergarten, but has been out three out of five days this week. So far we've been given no hope and can only deal with the situation as best as we can. He was misdiagnosed and mistreated for three years.

I was glad to see your request for help; we'd also like to know of anything that could be done. The doctor says to expect a corneal transplant down the road, but we'd like to hear of some relief right now.

— SP Kentucky

Rett Syndrome

Anonymous is looking to know where to find information on Rett Syndrome.

My daughter was diagnosed by her neurologist with Rett Syndrome in March of 2001. Often times, Rett Syndrome is misdiagnosed as Cerebral Palsy, as was the case with my daughter. This is due to similarities between the conditions and the fact that Rett Syndrome is rare and often unknown, even to medical professionals. The International Rett Syndrome Association is a great resource that would supply the information you're looking for as well as referral service, parent support contacts, and support research. Call 1-800-818-RETT, email them at irsa@rettsyndrome.org or visit their web site at www.rettsyndrome.org

—AW via e mail

DR. FEUDTNER'S NOTE: In addition to the resources mentioned above and in the orginal Search, one can also turn for additional information to the Rett Syndrome Research Foundation (www.rsrf.org).

Assistive Technology Help

DM is searching for information on what kind of computer to get for her home, especially one that is able to use the Internet and is compatible with having a cause-and-effect device installed for programs.

I believe that every state has technology assistance centers. Here in Florida, where we are known for having few resources, we have two excellent centers for technology, FAAST and ATEN. You should be able to find out how to contact the center in your state by looking in EP's annual resource guide. These types of centers were all listed together in one area. I recommend working with a non-profit center rather than going to a commercial web site because the former has no financial interest in your purchasing any specific product. I also advise you to work with a center where you can visit and see things first hand.

—CH via e-mail

Swim Diapers

CD has a 12-year-old son and is looking for some adult-sized swim diapers for him to wear in the pool.

At the World Congress on Disabilities there were at least four vendors selling reusable swim diapers. Two that I know of are Gabby's and Adrian's Closet. Erich Schnur from HA Bruno (eschnur@wcdexpo.com) should be able to give you contact information. Sportime/Abilitations also sells swim diapers (www.abilitations.com)

—CH via e-mail

I had the same problem finding a swim diaper for my daughter who is 16 years old. I finally found one from My Pool Pal-

continued on page 20

continued from page 19

Aqua Force (www.aquaforce.com). We have used them and they worked great for us. I have also found a couple of other companies with youth and adult swim diapers, including ATD (www.atdincdirect.com) and swimdiapers.com. You can check them out and see what is best for your son.

— SA, via e-mail

Reading Programs

B is looking to find ideas for a reading program for a 10-year-old girl with autism.

I have had much success over the years with the Edmark reading system. It is very systematic and concrete, both important characteristics for students with autism. It also does not require speech or phonetics. Our current emphasis on phonetic awareness and phonemic production is not very helpful to students who are nonspeaking or have other language difficulties. My other suggestions are that people with autism or related disorders, as well as persons with hearing impairments, tend to be very literal in their thinking. They may have difficulty manipulating fictional scenarios in their minds. Typical reading series for young readers tend to be fiction-based and this material may be very hard for some students to comprehend.

You may have more success focusing on reading for functional purposes such as learning about vacation destinations, reading recipes and directions, and looking through catalogs. Another option is creating your own reading materials based on factual information about something your student is particularly interested in. I have found that many people with autism are tremendously interested in facts about one or more subjects.

Some students may never enjoy reading fiction. Others may learn to enjoy it after they have had plenty of time to become fluent readers using text that makes sense to them.

— CH via e-mail

Comunication Problems

PA is looking for ways to communicate with her five-year-old son, who visually impaired and has hearing loss and is developmentally delayed.

Each state in this country has a program that serves children who are deaf-blind. This term does not mean that the child is completely deaf or blind, rather that the child suffers from a loss of both. You can check up the different states on the web at www.tr.wou.edu/dblink.

I work for the Deaf-Blind Program in South Dakota. The neat thing about these programs is that we accept the child as a whole. Lots of children have additional disabilities, and we work with all of them to make their lives easier.

—TN via e-mail

I work with children who have visual and hearing impairments. In our program, we use a system called tangible symbols. It uses three-dimensional cues to represent activities, objects, or places, such as "outside," which may be represented by some pebbles mounted on cardboard. You can start using these symbols by handing them to him when you begin an activity with that place or object represented. Eventually, he can begin handing you the symbols to express his desires. It's hard to carry around all these symbols, so you should try to make the cues as small as possible but still meaningful to your son.

Also, if your son's vision is good enough, he may be able to use simple line drawings (enlarged, if necessary) to symbolize words and ideas, instead of three-dimensional objects. There are a lot of good picture symbol stems out there. You can ask your son's speech/language pathologist about them.

— HV, Brooklyn, NY

Looking for Diagnosis

D&CP are looking for a diagnosis for their 16-month-old daughter, who has gross motor skills, very loose joints, and low muscle tone.

I have a son that is almost five years old who has a rare genetic disorder called Angelman Syndrome. Very few doctors or even neurologists have heard of it. Many parents with children who have Angelman Syndrome are misdiagnosed as having cerbral palsy or autism. We were fortunate that our son was diagnosed as having Angelman Syndrome at 15 months old, as the neurologist had seen Angelman in the past. For more information, go to the website www.angelman.org.

— D&R via EP Web Site

Seeking A Respondant!

A response to our homeschooling story in September's Parent Perspective from levernia@aol has Dynavox Corp. very interested in helping. Unfortunately, the email address is not operating and we would like to hear from her. Please write to dmazzella@eparent.com so that we can put you in touch with the company.

Epilepsy Research Project Needs Volunteer Families

If you or a member of your family has epileptic episodes, EP Magazine is asking you to participate in a new research project. Slated to begin in 2003, it will primarily center on non-medical aspects but with some questions on comorbity and other conditions. This highly confidential survey will attempt to quantify eplieptic incidence and other data. Please email epedit@aol.com or write to

INTERVIEW WITH DR. FRANCIS COLLINS

Dear Dr. Rader,

What an "exceptional" interview piece with Francis Collins by Lucinda O'Neill, highlighted in the October 2002 issue of Exceptional Parent. The future is indeed bright in anticipation of diagnosis and therapies for rare and more common diseases, education of health professionals from medical school to those in practice and for the advance preparation of ethical issues. Thank you.

Sincerely,
John Sarwark MD
Professor, Orthopedic Surgery
Northwestern University Medical School
The Children's Memorial Hospital

WCD

Dear Joe and Rick,

It was a pleasure and an honor to participate in what appeared to be a highly successful meeting. I think the mix of lay and professional attendees and speakers is the most appropriate format for mutual educational and collaborative efforts and I can only hope yours will serve as an example to other organizations, particularly in the rare disease community, as to how such interchange should be accomplished.

Kind regards,
Peter W. Stacpoole, Ph.D., M.D.
Professor of Medicine, Biochemistry and Molecular Biology
Director of Clinical Research,
University of Florida

AUTISM

Dr. Rader,

I was very disappointed you did not include the Autism Diagostic Observation Schedule (ADOS) and the Autism Diagnostic Interview (ADI) in your instruments used to assess autism. These two instruments, plus occupational, neurological, cognitive, and speech and language evaluations form the crux of state-of-the-art diagnosis of autism. Not only can we now diagnose autism around age 2, but science and research are pushing down the age of valid diagnoses. Early diagnosis is crucial to help these children, so please inform your readers not to wait if they suspect their young child is not developing typically. If your toddler does not regularly respond to his/her name when called and is not pointing, please have him screened for autism at a center that specializes in its diagnosis.

Sincerely,
Ketty Patiño González, Ph.D.
Clinical Assistant Professor of Psychology
University of Miami, Director, Autism Spectrum Assessment Clinic
Coral Gables, Florida

Dear Dr. Rader,

I realize that Exceptional Parent Magazine is meant primarily for parents rather than professionals, but lately there seems to have been a skew towards promoting, as opposed to presenting, alternative and unproven therapies. You previously heard from other physicians complaining about the apparent pro-bias for hyperbaric oxygen therapy in an article, despite the disclaimer that appears with every advertisement you accept. You have done a similar disservice, in my view, with the recent article summarizing alternative treatments for autism and other developmental disorders.

The author does note that, regarding sensory integration therapy, 'results in this area are preliminary at best', implying that every other approach has good research to support it. I have read Dr. Mehl-Madrona's text, and the fact is that there is no good evidence for the value of the therapies he describes, nor for their safety. Potential side effects such as cost, and time consumed, are not considered.

What is known about autism is that many children show marked spontaneous improvement between the ages of 3 and 6, regardless of therapy, pariticularly if they have some language skills going into that period. As such, any therapy conducted during this period is likely to seem successful for some children.

Conventional medicine certainly does not have good answers for the treatment of autism at present, and it is reasonable for Exceptional Parent to explore other options. However, I believe the magazine does owe parents your expert overview on controversial topics, rather than presenting them without comment, and, by implication, with your agreement.

Sincerely,
Jon Matthew Farber, M.D.

Dear Dr. Farber,

Thank you for the above email regarding Exceptional Parent Magazine's treatment of alternative therapies. It is our intent not to endorse alternative therapies, but to provide a forum for their discussion and further evaluation. This is in response to thousands of parents requesting information regarding these therapies. We do not endorse them, and indeed, clearly indicate that they are for the purpose of evoking discussions with physicians and other critical healthcare providers.

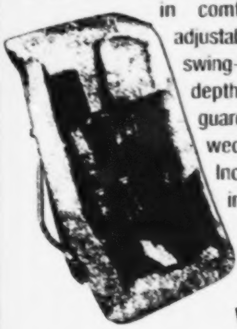
Rick Rader, MD
Editor in Chief,
EP Magazine

We encourage letters on any subject. Send them to: EP Magazine, Attn: Letter to the Editor, 65 East Route 4, River Edge, NJ 07661; Fax: (201) 489-0074; or E-mail: epedit@aol.com. Published letters may be edited for space and clarity. Unless otherwise requested, writers will be identified by full name and state. Please include your phone number and/or e-mail address on all correspondence.

Solutions for Daily Living
from Columbia Medical

Transporting

Since 1986, the **Columbia Orthopedic Positioning Seat** has been parents and therapists first choice in car seats. Suitable for children 20 to 102 lbs., it meets or exceeds all safety standards while offering the maximum in comfort, support and adjustability. Available with swing-away abductor, seat depth extender, buckle-guard and extensor thrust wedge accessories. Includes full-positioning pad set to customize fit and grow with the child.



Weighs only 11 lbs.

MOBILITY BASE

The Columbia Orthopedic Positioning Seat locks easily and securely onto the customized **Mobility Base.** The strong, lightweight frame offers three-angles of tilt and a height-adjustable footrest. Large wheels permit a smooth ride over any surface.

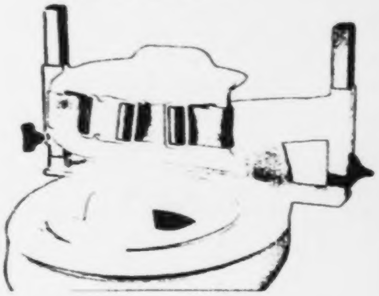
Bathing

Extension legs and casters are available to easily convert bath chair into a rolling shower chair.

Our NEW Fully Customizable Bath Chair, **Contour Ultima™** is completely configurable to meet an individual's unique needs. It offers the ultimate in positioning options and comfort. Available in four standard sizes and 192 custom-made combinations, the chair's seat, back leg length and seat width can be specified. The seat and back sections independently articulate providing full head and trunk support in both the sitting and reclining positions. Made of surgical grade stainless steel and replaceable ComfortMesh™ fabric. Includes two positioning belts for additional safety and security. The chair is sturdy, lightweight, easy to clean and fits in any standard tub.

Toileting

Our **Toilet Supports** attach and remove easily from any toilet. Available in both low and high backs, the supports can be used by children and adults.



Free Standing Bedside Positioning Commodes can be used independently or positioned over any standard toilet.

Columbia 800-454-6612 ext. 100

e-mail info@columbiamedical.com • www.columbiamedical.com

Since 1978, Columbia has manufactured products exclusively for individuals with special needs. All of our products are made in the USA of durable materials, are tested to the highest standards and are designed for maximum safety and comfort.

THE DIRECT SUPPORT PROFESSIONAL RECOGNITION ACT

Congressman Pete Sessions (R-Texas) and Congresswoman Lois Capps (D-California,) together with members of the American Network of Community Options (ANCOR,) have announced a resolution called the "Direct Support Professional Recognition Act." This legislation promotes greater attention on recruiting and retaining direct support professionals. The resolution highlights the shortage of trained direct support workers and will affect more than eight million Americans with developmental disabilities.

New Partnership Between Education Department and US Chamber of Commerce

In recognition of National Disability Employment Awareness Month, the US Department of Education has partnered with the US Chamber of Commerce's Center for Workforce Preparation, with the hope of helping employers reach out to the disability community to find qualified workers. In turn, the Education Department would offer its resources to the business community. The partnership was announced over the internet, as part of a Webcast entitled "Disability Employment 101: Learn to Tap Your Hire Potential." The event also featured officials from both government and private organizations discussing research, strategies and initiatives regarding disability employment.

Poison Emergency Kit

From HUMCO, a formulator of pharmaceutical products, comes a poison emergency kit, which brings poison awareness and safety to the home. Created in an effort between both HUMCO and the American Association of Poison Control Centers, the kit can be used to prepare parents to deal with dangerous situations with various toxins. The kit includes one ounce of ipecac syrup, one ounce of activated charcoal, a dosage cup, a Poison Emergency Information Guide, and a refrigerator magnet with the Poison Control Center's toll free number (800-222-1222). As mentioned in the product's literature, consumers are advised to contact the Poison Control Center before administering any of the syrup or charcoal from the kit.

New Bills Passed by Congress

On October 17, 2002, the Senate passed, both H.R. 4013, the Rare Diseases Act and H.R. 4014, the Rare Diseases Orphan Product Development Act, and will now go to President Bush for his signature. The Bills, which are sponsored in Congress by both Republicans and Democrats, are expected to increase rare disease research.

Homeownership for People with Disabilities

Fannie Mae is sponsoring a new mortgage loan called HomeChoice, designed to meet the needs of people with disabilities or those who have family members with disabilities living with them. This is reflected in their *American Dream Commitment*, a ten-year $2 trillion pledge to increase homeownership rates and serve 18 million targeted American families by the year 2010. It is currently available in 33 states with hopes to expand. To learn more about the HomeChoice program visit *http://www.efanniemae.com* or call 1-800-7FANNIE (1-800-732-6643).

The Gift of Giving

Time Inc. has introduced a new "Paddy Pillow" to their line called The Gift of Giving. Their products are designed to help adults and children communicate their feelings, so children can learn how to identify, understand and express emotions in a healthy way. Pillows come in both large and baby sizes and each contains a book. The Gift of Giving book features a "Paddy Pillow" expressing emotions associated with the holidays such as excitement, thankfulness, jealousy and disappointment. For more information visit http://www.paddypillow.com

Bill for Inclusive Schools Week

New Jersey legislators have proposed a bill to designate December 2-6 to be New Jersey Inclusive Schools Week, in recognition of the work done by parents, students, and school officials in maintaining a safe and inclusive educational environment.

NATIONAL ORGANIZATION ON DISABILITY WINS TWO MEDIA ACCESS AWARDS

The National Organization on Disability (N.O.D.) was the winner in two categories of the Media Access Awards presented by the California Governor's Committee for Employment of Disabled Persons last month. The honors went to the N.O.D. for both its redesigned web site (http://www.nod.org) as well as its public service announcement entitled "It's About Ability." N.O.D.'s newly designed web site was noted particularly for the accessibility of information that it offered. And the PSA, which featured a number of celebrity endorsements from figures like Harrison Ford, Christopher Reeve, Angela Basset, and Stevie Wonder, was also underwritten by sponsors Microsoft, the Presidential Task Force on the Employment of Adults with Disabilities, the McGraw-Hill Companies, and American Express.

Child Neurologists Honor International Rett Syndrome Association

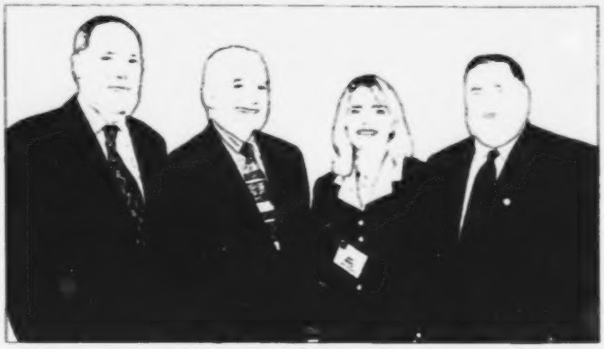
The First annual Patient Advocate Award of Merit has been awarded to the International Rett Syndrome Association (IRSA) by the Child Neurology Foundation. Kathy Hunter IRSA's President received the honor for outstanding public leadership among patient groups representing children with neurologic illnesses.

Kathy Hunter, President, IRSA

During the past several years the efforts of IRSA have led to significant advances in Rett Syndrome, a progressive developmental brain disorder affecting 1:15,000 newborn girls. The 18-year-old volunteer agency founded by the parents of children with this rare, life-altering disorder received widespread media attention during their advocacy efforts seeking increased funding from Congress. Among those providing compelling testimony was actress Julia Roberts, who earlier this year hosted and narrated the acclaimed documentary: Silent Angels, a nationally broadcast Discovery Health film about Rett Syndrome.

Since the group's founding by a small, but dedicated corps of parents in 1984, more than $35 million has been appropriated by Congress to the National Institutes of Health for the in-depth study of the disease, including $2.33 million in promising seed grants. Recently, the gene that determines this unusual disorder was identified.

"We are pleased to introduce this new award and to recognize this outstanding group of dedicated individuals for their efforts to link families affected by this tragic disease. The parents, physicians, and caregivers of the IRSA provide families the comfort and encouragement they deserve while ensuring that scientifically-sound information about this disorder is widely disseminated in a timely manner," said Dr. Kenneth Swaiman of the University of Minnesota, President of the Child Neurology Foundation at the annual meeting of the Child Neurology Society in Washington, DC.



From left to right: Steve Ashwal, MD, President, CNS; Ken Swaiman, MD, Chairman, CNF; Juile Vemmers Yannes, Chair of the Foundation Advocacy Committee; Joseph M. Valenzano Jr., Chairman of the Advisory Board to the Child Neurology Foundation.

Child Neurology Society President, Dr. Stephen Ashwal of Loma Linda University, CA praised the group for their internationally recognized patient database. "By establishing the MECP2 Variation (Rett Base) and Phenotype Databases, they have made it faster and easier for researchers to compare patients' mutations with their clinical symptoms while providing exciting opportunities for the discovery of new treatments!" Said Ashwal.

The 30-year-old Child Neurology Society is the professional organization representing more than 1,300 pediatric sub-specialists worldwide whose academic, research and practice careers are directed toward providing care to children with disorders affecting the brain and central nervous system. In 1999, the Child Neurology Society established the Child Neurology Foundation, a non-profit organization whose mission includes the development and funding of public and patient education, scientific research and advocacy initiatives on behalf of children afflicted with neurologic and developmental disorders.

Among the projects that will be undertaken are the collection, selection, and editing of materials to be formed into useful, pragmatic informational packets distributed to child neurologists worldwide. The material will also be distributed through the Foundation web site, ww.ChildNeurologyFoundation.org. and the EP ("Exceptional Parent") web site www.eparent.com that is linked to over 130 national organizations and associations.

ECHO Radio Program

The Ronald McDonald Children's Hospital of Loyola University Medical Center is now running a radio program called Every Child Has Opportunity (ECHO) in partnership with Lyons Township High School and WLTL-FM. There, young patients are given an opportunity to act as the DJs and talent of the radio station from 4 to 8 p.m. on the children's hospital floor. ECHO is made available by the hospital as part of its Reading, Writing, and Recovery School Program. The radio show features a number of subjects, including contests, giveaways, music, as well as children's news and health segments.

New Leadership at VSA

Very Special Arts (VSA arts) recently announced the appointment of new leadership to its organization. Soula Antoniou was named as the new president, while Mike Magee, MD was brought forth as board chair. Ms. Antoniou has been with VSA arts since 1993, and was recently selected as the executive director for the 2004 International VSA arts Festival. She was also successful in developing the VSA arts affiliate network, which now consists of affiliates in 49 states and the District of Columbia, as well as over 60 countries around the world. Mike Magee, MD, who was elected to the board of directors of VSA arts in 2001, is also the director of the Pfizer Medical Humanities Initiative, which allows him to speak internationally on a variety of health and public policy issues. In addition, he is a national spokesperson for the Senior Olympics, and has authored a number of books on medicine and other subjects.

The MDA and Mattie

Young poet Mattie J.T. Stepanek has accepted an invitation to serve a second year as the National Goodwill Ambassador for the Muscular Dystrophy Association. Mattie has a rare disease related to muscular dystrophy called mitochondrial myopathy. However, that hasn't stopped him from becoming the best-selling author of four books of poetry (Heartsongs, Journey Through Heartsongs, Hope through Heartsongs and Celebrate through Heartsongs). MDA National Chairman Jerry Lewis says of Mattie, "He expresses our message beautifully, and I know he'll move the hearts of millions more Americans next year as he's moved millions this year."

New Education Center for Children with Autism

The Department of Education unveiled a network of resources for improving education for autistic children when it announced a $5 million grant to set up the program. The network will be headquartered at the University of Washington and will include additional centers at five other institutions around the country: the University of Colorado at Denver; the University of South Florida; Ohio State University; the University of Kansas; and the Maryland Coalition for Inclusive Education. School districts throughout the US will be able to participate, as each will receive an expert from one of the six institutions involved to assess the district's specific needs. Afterwards, at one of the participating institutions, autism experts will host up to six educators from one school district at a time for a weeklong training session. A follow-up visit will be made to each school a month after each session to check up on the implementation of plans made during the training.

F.A.C.E.S. Art Day

Fight Against Childhood Epilepsy and Seizures (F.A.C.E.S.) hosted their sixth annual free art day on October 20, 2002 at The Children's Museum of the Arts in New York City, NY. It was a great opportunity for children with epilepsy to meet others, as well as parents to network with other parents. There were booths throughout the building for the kids to work on different art projects. There was also a face-painter and a balloon artist present. For more information and for news of next years event contact Christine Toes at (212) 779-2041.

AAMR F.Y.I

The AAMR FYI web site is now online. To access the site, visit http://www.aamr.org/FYI/ where visitors can find current and past issues of AAMR F.Y.I.

SCOTLAND DISABILITY AWARENESS SURVEY 2002 REPORT

Recently, Scotland's Disability Rights Commission conducted a survey of 1000 adults in Scotland to get an estimate of the public awareness of discrimination faced by the disabled community. The results of the survey found that 85% of those polled were aware of discrimination against people due to their disability, and even a greater majority (93%) felt that children should be taught about disabilities in school under the field of citizenship studies. More than half of those polled felt that people with disabilities are not given fair treatment in society, and almost two thirds think that the disabled are not properly represented in the government.

Outdoor Adventure Trips

Wilderness Inquiry is a non-profit organization which designs outdoor adventure trips for all people – including those with disabilities. The trips planned for February and March 2003 are canoe trips to tropical Florida Everglades and Boundary water ski and dogsled in Minnesota. These trips connect people of all ages, backgrounds and abilities so that everyone can learn to appreciate those that are different. For more information on these trips visit http://www.wildernessinquiry.org or call 612-676-9400.

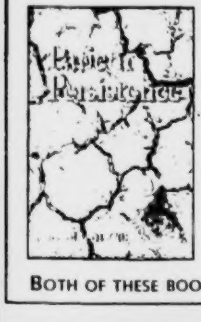
No Apologies For Ritalin ◦ BY VIDYA BHUSHAN GUPTA, MD ◦ EP8012AD- $19.95

Despite its name, No Apologies for Ritalin is aimed at educating parents of children with ADD by presenting all the treatments available for the disorder.

The first half of the book is a look at what ADD is: the medical aspects, how it is diagnosed, and what causes it. Anecdotes of children diagnosed with the disorder and a discussion of how doctors arrive at their diagnoses begin the book. Issues that parents must deal with, such as understanding and coming to grips with the diagnosis of ADD, whether ADD is a product of bad parenting style, ADD's occurrence with other disorders, and who is most at risk are discussed in this section as well.

Section 2 presents the pros and cons of all treatment options, both conventional and alternative, including non drug therapies such as psychotherapy and behavior modification. The author, Vidya Bhushan Gupta, MD, MPH, FAAP, writes in his Foreword, "I have discussed the controversy surrounding the use of Ritalin and tried to dispel myths surrounding ADD and Ritalin: 'ADD is not a disease; it is simply a difference of temperament;' 'ADD is due to poor parenting;' 'Ritalin is a mind-altering drug like speed;' 'Don't give Ritalin to your children because they will get hooked on it.'" He explains that his purpose for writing the book is so that "parents of children with ADD will not blame themselves for their child's predicament and will be able to use all the available treatments, including Ritalin, without guilt."

The book offers insights into other issues regarding ADD as well, including: who should treat the disorder and what the goals of that treatment should be; suggestions for parents on dealing with their child's ADD; whether children grow out of their ADD; and how to de-emphasize the negative labels of the disorder by recognizing and building on the strengths of children diagnosed with it.



Patient Persistence ◦ BY ADELE M. GILL ◦ EP8004GN-$19.95

Patient Persistence celebrates the ability of people to overcome obstacles to achieve their goals. Author Adele Gill invited individuals from every background to tell their stories of "hope, courage, hard work, and endurance related to health, disability, relationships, family, ministry, career, accomplishment and challenge."

Ms. Gill is a certified disability analyst/fellow with the American Board of Disability Analysts, and an advocate of inspirational/motivational self-help. She writes, "Patience and persistence are qualities that are vital to the discovery of our finest, God-given gift, the resilient 'Indelible Human Spirit.' These innate qualities propel people and enable them to do great things and overcome significant hurdles."

Patient Persistence is both motivational and inspirational, offering help and hope to anyone who feels that his or her life is out of control, or that things have gotten so bad that there will never be a way to make it better.

BOTH OF THESE BOOKS ARE AVAILABLE THROUGH THE EP LIBRARY BY CALLING 1-800-535-1910, OR BY VISITING THE WEBSITE AT WWW. EPLIBRARY.COM

Family & Community

BACK TOWARD NORMAL: HOW OUR FAMILY RECOVERED AFTER ALISON WAS BORN

By Genevieve Anton

I'll guarantee that every parent, at some point between the thrill of conception and the anxiety of the delivery room, has experienced the same fear: What if something is wrong with my baby?

Most of us like to think we would do anything, make any sacrifice, for our children. But when the vague fear you have tried to stifle becomes a reality, when your child is born with a severe physical or mental disability that threatens your own freedom and lifestyle, that commitment is put to the test.

After you have experienced the shock, the denial, the grief, it slowly begins to dawn on you. Your life has changed forever, in ways you never expected, never wanted, never dared to imagine.

I know. It happened to me.

My husband, Mike, and I were journalists in our mid-30s living in Denver when we first felt "the fear." We were far from our families, and ready to start our own. But our worries quickly dissolved when our son, Christopher, was born. He was absolutely perfect: healthy, strong, bright and adorable.

So four years later, when Alison was but a flutter inside me, we weren't quite as nervous. Our family history was clean. The amniocentesis, a test for chromosomal abnormalities, was normal. The pregnancy was going smoothly.

However, things went awry in my third trimester. I developed what is called polyhydramnios, or excess amniotic fluid that stretched my uterus so painfully I was put on half-day bed rest. Although my obstetrician tried to reassure us it wasn't necessarily a sign of trouble with the baby, the fear again bubbled to the surface.

Our attitude improved when I reached full term. Although we had an emergency C-section after 12 hours of labor, Alison was born at a robust 8 pounds with flawless skin, a full head of light brown hair and a delicate mouth shaped like a rosebud.

Her toes, I noticed, were a little crooked. That's all.

Still, we watched her closely. There was this nagging sense we weren't out of the woods yet. She slept an awful lot - up to 20 hours a day - and like a newborn puppy, couldn't seem to open her eyes. Alison would not latch to the breast, and often choked on the bottle of pumped breast milk. Her breathing was loud and raspy. She lost weight.

My pediatrician saw her once a week. He, too, assured us nothing terrible was wrong. Some babies just don't breastfeed, are noisy breathers and sleep a lot, he said.

It wasn't until I took the children to visit my family in Atlanta when Alison was seven weeks old that everything came crashing down. Fast. Hard. Unexpected.

"Just make it go away." At first, we thought it was allergies - that the little pollens wafting around in the humid Southern air had caused her respiratory attack. But the moment my sister's pediatrician saw Alison, he sent her to the emergency room and she was immediately admitted.

It was bad, and it would get worse. Her oxygen level was dangerously low, she was sucking milk into her lungs and her muscles were extremely weak, or hypotonic. Alison stayed in the Atlanta children's hospital for two weeks on oxygen and an IV, with a tube threaded through her nose to bypass her lungs and put milk in her stomach.

A parade of specialists examined her, took copious notes, huddled in the hallway. Radiologists scanned her brain and made X-rays of her body. Lab technicians took samples of everything - her blood, her urine, her mucus, her sweat - to run diagnostic tests.

No one could tell us

Mike, Genevieve, Chrostopher & Alison Anton at Golden Gate Bridge in San Francisco.

what, exactly, was wrong with Alison.

My mother says she vividly remembers finding me sitting cross-legged in the guest room, putting her arms around me and saying, "Is there anything I can do?"

"Just make it go away," I whispered.

Alison needed surgery to insert a tube into her stomach so she could eat, and a constant supply of oxygen. The doctors ordered a private medical transport plane to take us back to our home in Denver for the operation.

I cried the whole way home. I had never in my life felt such a deep, painful depression. For the first time since the crisis began, I started thinking about the future. Would Alison live? If she did, what would her life be like? And, to be honest, would taking care of child with chronic medical and developmental problems destroy our lives?

There were four of us - a nurse, a respiratory therapist, an emergency medical technician and myself - wedged into a cramped cabin with Alison strapped to a gurney in the middle. I watched silently, helplessly as they monitored her vital signs. She was so still and quiet. Her small chest was wired with electrodes, an IV bag swayed above her head and a tube in her nose pushed puffs of oxygen into her lungs.

My grief was intensified by a growing sense of claustrophobia in that airborne cage. I felt trapped and sick to my stomach. I was about to lose something vital and irreplaceable: not just the daughter of my dreams, but the essence of my life as I knew it.

My mind was flooded with thoughts about everything that would change. To take care of Alison, I would have to quit my job, cutting our income in half, and pull my son out of preschool.

I wondered if Mike and I would ever go out to dinner again, much less take a vacation alone. I thought about how much we love to travel abroad, to ski and hike in the mountains, to find hidden hot springs or alpine lakes, to explore new places. About the simple luxury of a good night's rest without being rudely awakened - and thrown into panic - by the ear-shattering beep of an apnea monitor.

These thoughts seemed so selfish. I felt guilty.

But ironically, it was the determination of our family to restore some sense of normalcy to our lives that helped us survive. It also changed our attitudes about what was possible for Alison, and brought her snugly into our warm fold.

Only later did I realize my feelings were not ignoble, nor unusual.

It's OK to feel selfish - and a little scared. Among the mountain of books on special needs children I've read over the past two years, there is usually a chapter on how it changes the family dynamic. The repeated physical and emotional crises. The canceled plans and ruined schedules. The financial burden of medical bills. The unrelenting pressure of caring for the child's needs.

"Finding out that your child has special needs is an emotional earthquake. Everything seems broke, turned upside down," writes Judith Loseff Lavin in her book, *Special Kids Need Special Parents*.

Extreme disappointment is inevitable, she says, as are questions such as, "What are we going to do?" or "How will we go on?"

"Parents often contact a myriad of specialists, hoping to find one who will tell them what they want to hear - that somehow life will go back to normal," writes Dr. Stanley Greenspan in the book, *The Child With Special Needs: Encouraging Intellectual and Emotional Growth*. Once they realize that's not going to happen, both parents may become terrified - terrified of their new life, terrified their marriage may fall apart, terrified they won't be able to handle whatever comes next.

Every family faces unique challenges and changes in life, but these are magnified for the family of a child with

continued on page 30

continued from page 29

a disability, according to Dr. Mark Batshaw, director of the Children's Research Institute, in his book *Children with Disabilities*.

"How the family handles day-to-day stresses, concerns and needs of its members influences, to a great extent, the outcome of the (special needs) child," he writes.

It was certainly the biggest change, and challenge, our family had encountered. At first, Mike and I were overwhelmed and confused, unsure how we would fare. People used to tell us we had been "chosen" to take care of Alison, because somehow we were special. But we didn't want to be special; we wanted to be normal.

Breaking free of the paralysis, our journey back toward normalcy began in an unexpected way. When Alison was four months old, my husband was offered a job at The Los Angeles Times. At the time, it seemed too soon to move. Alison was weak...we were exhausted. But it was a good job with better pay. And we hoped that leaving "The Mile-High City" to live at sea level might help Alison breathe easier.

It was a bold move, one that would force us to break out of our newly narrow - yet already familiar - existence. It would pitch us together and fling us across 1,000 miles to a different life. It would test our spirit and resolve.

First we had to cross the Rocky Mountains. We drove two cars and I insisted on taking Alison, along with her oxygen tanks and equipment. As we reached the top of the Continental Divide at almost 12,000 feet in altitude, she began to gasp. I startled at the shrill screech and red warning light of the pulse oximeter on the seat beside me. The oxygen content in her blood quickly dropped from 95 percent (good) to 88 percent (risky) toward the 70s (really bad.)

I pulled over to check on Alison, and watched in dismay as Mike's taillights faded away into the night. She had to get to a lower altitude fast, so I turned up her oxygen, hopped back in the car and speeded down the winding curves of interstate 70, feeling like an ambulance driver and thinking all the while, "This is crazy. What are we doing?"

Thankfully, Mike had pulled over at the first exit to

Your Family's Freedom is Here:

The Rear Entry Kneelvan.

The whole family fits: Kneelvan seats up to 7 people.

Scooters and chairs that won't fit in other vans can fit in a Kneelvan.

Kneelvan is the most reliable lowered floor minivan ever.

More ground clearance than any other lowered floor minivan.

Kneelvan's rear entry design can park anywhere, even in regular parking spots.

Designed with your family in mind, the **Kneelvan is simply the easiest way to travel**. Unlike side-entry conversions, we designed the rear entry KneelVan so you can **never get blocked by someone parking next to you**. Kneelvan is perfect for families with kids: its the best family van ever.

We would like to invite you to compare Kneelvan for yourself. Call today for more information and our free video.

Circle #30 or visit www.eparent.com/adinfo

wait for us and Alison began to breathe much easier in the valley below. We forged on, shaken but resolute.

Daylight and flat land in Utah brought hope and relief. Alison recovered nicely and stayed well the rest of the trip. She cooed happily in the car, sat patiently as we ate at restaurants (unlike her brother) and gamely went along in her stroller or my arms as we began to venture out and explore the barren beauty of the canyon lands.

As the 10-day trip continued, we became more adventurous. We took the Subaru off-road in Navajo country. We climbed up rocks and into shallow caves around Monument Valley. We hiked along the South Rim of the Grand Canyon National Park and watched the sunset from an isolated ledge with the kids on our laps.

Christopher & Alison

Everyone was surprised at how much we could do with Alison along, as long as we kept her comfortable and the hikes short. We stopped more often than normal, for her tube feeds and medication. Every night we set up her crib, pump and tanks in the hotel room like a miniature ER, with Christopher happily curled up on the floor beside her in a sleeping bag.

Alison was a real trooper, a good-natured baby who smiled a lot and hardly complained at all. She just loved being around us all the time, whether in the car or on a trail or wedged into a 10- x 20-foot converted garage of a friend in Long Beach, where we stayed for six weeks until we bought our home.

This was not the fragile baby on the plane; Alison had stamina and resilience.

The adventure recharged us, and the experience of living in such close contact for three months strengthened our bond with Alison. She was now one of us, and we could no longer imagine what it had been like without her.

Life goes on...and you must go with it.

Once we settled into our new home in Tustin, we began to venture out more often than we had once thought possible. Over the past year, we have driven more than 1,400 miles across California from San Francisco to San Diego to campgrounds and hiking trails across the Sierra Nevada Mountain Range.

We invested in an extra-sturdy baby backpack for hiking, a three-wheeled baby jogger for off-road exploration and a small pop-up tent to shelter Alison from the sun. Because she had so little strength in her body, especially her neck, we rigged an infant seat into Christopher's old Burley trailer so we could take family bike rides.

Of course, we also took every precaution for Alison's health, and packed plenty of medications, extra oxygen and emergency supplies.

Life was starting to get better, but it was not free of problems. There was the time Alison suffered a respiratory attack halfway into a hike in Mammoth Lakes. And after that, an eight-hour ride home in the early morning hours when she got sick on a trip to Yosemite National Park. We even had to leave a weekend camp for special needs children last summer when Alison couldn't keep down her formula.

Yes, there have been canceled vacations, delayed holiday celebrations and missed nights out. We plan our lives around Alison's illnesses, and she is sick a lot. Last year she was hospitalized eight times with various respiratory problems. She also had heart surgery to close two open valves, not to mention a slew of new diagnostic tests and more than 50 office visits to her pediatrician and more than a dozen specialists.

I grew so weary of answering the seemingly simple question, "So, tell me about Alison..." that I wrote a 16-page summary of her medical and development history that I update every month and hand out to hospitals, doctors and therapists.

Genevieve & Alison at Lake Tahoe

Some doctors suspect Alison suffers from a neuromuscular disorder that contributes to her chronic health problems and severe developmental delays. Yet so far her unusual condition has defied diagnosis, and her prognosis is still unclear.

Simple milestones, such as crawling or eating a Cheerio or saying "mama," are still beyond her reach at two years of age. Although Alison is making progress every day, we don't know whether she will catch up or simply fall further behind.

Even when Alison is well, she attends physical, occupational and oral/speech therapy sessions six times a week. On top of all that, there are untold hours of boiling medical tubes, filling prescriptions, reordering equipment and dealing with a stack of insurance claims that is already five inches thick.

As daunting as this

continued on page 32

Family & Community

continued from page 31

sounds, there are parents out there who face even greater challenges. I've seen children in the hospital who are immobile, unresponsive or heavily dependent on medical support to survive. I know parents whose children have severe emotional or behavioral problems that drain their patience and test their love.

But if we've learned anything through all this, it's that attitude is more important than circumstance. You can't always control what happens to you, but you can decide how you'll react to it. Our aim is to find a balance between Alison's needs and our own, and somehow make it all fit together as a family.

Dreaming new dreams. Life is hardly "back to normal" now and it probably never will be. Yet it isn't the nightmare we once imagined.

I don't pretend it's easy, or that we've been the perfect parents. Yet, as strange as it seems, there is a certain sense of pride that we've come this far. We changed, we grew and we found an inner strength we never knew existed. It certainly wasn't a path we wanted to go down, and the end is not yet in sight.

But we've finally started living our lives again - and our children are right there beside us, all the way. **EP**

SURVIVAL TIPS FOR TRAVEL WITH SPECIAL NEEDS KIDS

- Get a quick checkup with your pediatrician before heading out of town, and ask what precautions you should take.
- Make a list of all your child's critical medical information, including history, prescriptions, allergies and the pediatrician's office and home phone number. Carry it with you everywhere you go, even on a hike.
- Find a hospital, pediatrician and medical equipment provider close to your destination. Check with your insurance company to see who's in network, how much is covered and what you need to do if your child gets sick out of town.
- Pack plenty of your child's medications, emergency supplies and any equipment that might be difficult to obtain without a prescription.
- Carry a mobile phone, emergency first-aid supplies and plenty of extra food and warm clothing with you in the car, on the trail or in remote areas.

HELPFUL WEBSITES

- The American College Of Emergency PHYSICIANS: Offers an Emergency Medical Sheet for children with special health needs that you can download from their website at www.acep.org.
- The Children With Disabilities: www.childrenwithdisabilities.ncjrs.org. Federal initiative to provide children with disabilities and their parents access to a wide range of resources including outdoor recreation.
- Comfort Connection: www.comfortconnection.org, 714.558.5400; toll free: 888.FRC.BABY. A place for parents of special needs children to make a connection with others involved in the enormous task of caring for a child who is born medically at risk or with a disability.
- Internet Resources for Special Children: http://www.irsc.org. A good starting point for information about outreach and resources for children with disabilities.
- The National Information Center for Children and Youth with Disabilities: www.kidsource.com/NICHCY. 800.695.0285 (Voice/TT), 202.884.8200 (Voice/TT). NICHCY is an information and referral center that provides information on all disabilities and disability-related issues as well as referrals to a wide network of specialized organizations and agencies across the country.

PREVENTABLE
DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

You may be entitled to lifetime benefits.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

Family & Community

FAMILIES TELL US: What makes families STRONG

Beginning in the late 1980s, a new emphasis began to appear in research about the families of children with disabilities. This new perspective focused on how families succeed and used words like strengths, coping, resilience and empowerment.

What do these terms mean to families that include a child with a disability? We know that families are the real experts on this topic, so we turned to them to learn more. The goal of our research was two-fold. First, we wanted to learn, from the families themselves, about the strengths that they value most. And second, we wanted to alert professionals to these strengths, so that they could both acknowledge them and help families to build on them. One parent who talked with us made it clear why this is so important:

"Seventeen years ago, when our daughter was diagnosed, nobody told us any strengths. It was all like, 'Well, this is going to be really horrible for the rest of your life ...' [But] it can be a good experience, and we would do it all over again. Her brother had more responsibility than he needed to have because I needed somebody who could take phone messages when he was six years old. I thought at the time, 'Maybe this really sucks and I'm screwing up his life.' In fact, it has turned out totally the other way."

FAMILIES DESCRIBE THEIR STRENGTHS

This study was carried out by staff at the Center for Disabilities and Development, a component of the University of Iowa Hospitals and Clinics in Iowa City, Iowa. We provide health care and other services for people with disabilities and for their families. We asked each family:

- What are your strengths?
- How do you account for them?
- What strengths does your child with a disability bring to your family?
- What factors outside your family help nurture your strengths?
- How has your family changed as the result of having a child with a disability?

Each of the 38 families we talked with had been using services at the Center for at least a year. Their insights provided a clear perspective on what they see as the sources of their strength. Their answers identified six key factors: teamwork, family support, patience, hard work, adaptability and spiritual strength.

TEAMWORK

Teamwork, within the family and with people outside the family, is a primary source of strength. Within the family, both single parents and married couples tell us it is essential. "We are strong in hugs, and thanking each other, and asking each other for help when needed," says one parent. And families take pride in this strength: "We are incredibly bonded and dedicated to each other. We're tested more, but my husband and I have come through."

Brothers and sisters are also key members of the team. "If we both happened to be down," one family tells us, "the kids would say, 'We can get through this together.'" A mother speaking of her 11-year-old son says, "In the past he had said, 'I wish I had a regular brother, I wish I had someone to play with,' and there are really some hard, sad things said like that.

But over the years he's been such a support, and he'll help in any way that we ask. I'm pleased at the qualities I see in him." A father says, "We pretty much rally together to meet our child's needs—and each other's."

FAMILY SUPPORT

Families often speak of the strength that grows out of family support. This includes the bonds among siblings and grandparents, and those that single-parent families especially, share with aunts, uncles, and grandparents. One mother summed up this support very simply as "knowing I am not alone."

Making time for the family is one way to nurture this strength. "We always share the day's activities at dinner. We practice really hearing our children, what they have to say," says one parent. Another comments, "We work hard to be supportive of all our children." The support that families get from friends is also a source of strength. For example, "I have a couple of good friends who support me by getting me out of the house," says one young parent. "And they reassure me that I'm doing fine; they provide me with a positive outlook." Another parent comments, "We have learned to access support groups—other parents are the best help."

PATIENCE

Families tell us that patience, with yourself and others, is crucial. "You have to be strong, you have to laugh over things," says one mother. "We take it day by day. We had strengths before, but we are much closer as a family now." Another suggests, "Believe that things will work out over time." One mother says that she has learned to "let the little things go, both physically and emotionally."

HARD WORK

Plain old hard work is also key. A single mother describes herself as "a workhorse," holding down two jobs and still enjoying the time she can spend with her son. Another single mother says that one of her strengths is simply her ability to keep going every day. A father talks about his family's work ethic, and says, "We try to lead by example." A mother comments, "She needs more taking care of, and love, but there isn't anything wrong with that."

ADAPTABILITY

Families tell us that flexibility is important. Several parents reflect on how they have become more aware, more knowledgeable, and more assertive as a result of talking with others and learning to network. Another says, "We have a better perspective now on what's a big thing, what's a small thing."

"We've gone through so many trainings, and we've learned not to accept the word no," says one mother. "And from 'no integration,' today [our daughter] is mainstreamed 55 percent of the time." Another credits her husband's self-help reading, and describes his creativity in making their home more accessible.

Recalling the first sign language class she attended, one parent remembers that there were "cousins and aunts and uncles and nephews, grandmas and grandpas, that went to the signing class to learn how to sign. You know, I always wanted to learn a different language, but I never would have learned sign language before, and it's really become a positive thing in our life and our family."

STRENGTHS OF THE SPIRIT

Many families find strength in their faith in God. "I don't find answers," says one mother, "but I do find peace." Others cite such strengths of the spirit as compassion, tolerance, a sense of humor and being slower to judge others. "Our values haven't changed so much as deepened," says another parent. "You know you can't put yourself first anymore," one parent explains. "Now I'm a fighter, for all of them, and this gives my life meaning."

Families tell us that children with disabilities contribute to their families in many ways—through their sense of humor, happiness, cheerfulness, patience and courage. One mother talks about how many friends her son has: "People like him all over town." Several talk about their child's strength of will in getting through medical crises and overcoming things, and others com-

continued on page 36

continued from page 35

ment on their child's plain determination. "He is a hard worker," says one, while another asserts, "My son is alive today because he's stubborn and determined."

Love and admiration are common themes: "She's strong in the face of pain and fear," says one mother. "Sometimes I think she's almost too strong. She is so large in such a little body." A single mother says, "I came close to giving him up for adoption; it all looked too overwhelming at first. But now there is joy and peace in simple things. It doesn't take a whole lot to find happiness. I don't know—how can you describe intangible things? He grounds you. I don't understand why I'm his mom; other people would be better at it than me. But then I think, 'Nobody can love him like me.'"

HOW DO WE PUT WHAT WE'VE LEARNED TO WORK?

Every family has strengths that make it special. Recognizing, acknowledging and building on these strengths make a family stronger. Too often, though, families and professionals alike focus on problems or concerns, and neglect to acknowledge the strengths a family can call upon. As a result, families may feel unnecessarily overwhelmed.

Families have so much to teach us—and each other. As professionals, we are learning to listen better, so that we can help families come to understand the traits that make them strong. Together, families and professionals can find solutions that reflect, and tap, these strengths. Clearly, they are a powerful resource, one that should be acknowledged, nurtured, called upon — and celebrated. EP

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

Richard A. Neubauer, M.D., Medical Director

Since 1972, we have been committed to providing the finest outpatient treatment available using hyperbaric oxygen therapy. Dr. Richard A. Neubauer has dedicated himself to the ethical expansion of hyperbaric oxygen therapy for severe neurological conditions. Specializing in cerebral palsy and the brain injured child, he has successfully treated the following:

- **stroke**
- **closed head injuries**
- **near drownings**
- **multiple sclerosis**
- **chokings**
- **shaken baby syndrome**
- **carbon monoxide poisoning**

Dr. Richard A. Neubauer and the Ocean Hyperbaric Neurologic Center are pleased to announce:

The 3rd International Symposium on Hyperbaric Oxygen in Cerebral Palsy and the Brain Injured Child

Richard A. Neubauer, M.D.,
Symposium Director

July 16-19, 2003
Fort Lauderdale, Florida

For information on the upcoming Symposium, call

NOT JUST LOVING PETS

Dogs Improve Quality of Life

By Laura Apel

Above: Sunni Foty, 8, from Minnesota getting help from her canine companion Roan.

Left: Haley Eidsen, 8, with her mother Cindy Eidsen and their just graduated Skilled Companion Dog, Zeb.

All a dog truly knows is love. Spend time with one. Look into their eyes. The love encompasses. They live for their people, would do anything to protect their loved ones and never ask for anything in return. They just love.

Assistance dogs, those specifically and expertly trained to assist people with disabilities, are perhaps the most dedicated and devoted of all. They become the eyes, ears, bodies, minds, and best friends of those they pride themselves in serving. Assistance dogs save lives.

These animals are raised to become the constant companions of adults and children with special needs. They are trained with the capabilities of picking up objects, turning off light switches, guiding through traffic and alerting after specific sounds.

Most Assistance Dogs have one universal skill in common that outshines and far exceeds all of their physical capabilities. These dogs bring love, attention, devotion, confidence, and belonging to their human partners that many have never before experienced.

Assistance dogs bridge the gap that exists between those with and without disabilities. They decrease the helplessness and the sense of loneliness that these individuals so often feel and enable them to take part in social activities that they had previously been prevented from joining.

continued on page 38

continued from page 37

Canine Companions for Independence (CCI), is the oldest and largest non-profit provider of assistance dogs for people with disabilities. Since 1975 CCI has been recognized for its excellence in placing their extremely qualified dogs with the people that they can best serve.

Matt and Lenora Thompson with their dog Odyssey.

Temperament, desire to please, social nature and adaptability are the key elements of the selection process in determining which dogs are best suited for particular jobs. CCI assistance dogs are one of three types of canines: Labrador Retrievers, Golden Retrievers, or a cross of these two breeds.

There are two parts to the training process. For six months each assistance dog undergoes a minimum of six months training with a professional CCI Instructor and then completes a two-week Team-Training with their future human partner.

These dogs are never aggressive or noisy, never have "accidents" in public and take their work very seriously. *A good example can be witnessed through Levi the dog in the new series F.B.Eye (see sidebar).* Each CCI dog has passed or exceeded the level of training that is required to earn public access under state and federal laws, including the Americans with Disabilities Act.

CCI Assistance dogs are trained to serve the needs of those with all different forms of disabilities. There are four categories that the dogs are placed, trained, and later partnered in.

Service Dogs. These dogs are trained to work with an adult who is disabled but who has the physical ability to work independently with a canine. Service dogs are matched with people of all different lifestyles and occupations and are trained to perform specific tasks that are designed to enhance the independence of their part-

Puppy Love

By Ann Allen

Heroes. We've heard this word in the news a great deal recently, and for good reason. They're all around us. Firefighters, police officers, rescue workers, Red Cross volunteers. The list is endless really. Our family recently encountered more people to add to the list. I'm referring to the people involved with the non-profit organization, Canine Companions for Independence.

My son, Eric, was recently the lucky recipient of one such companion. Eric's gentle dog is a beautiful two-year-old female who is a cross between a golden retriever and lab. Her name is Bethany and she weaseled her way into our hearts approximately 48 hours after learning of her existence. When she looks at Eric with her expressive brown eyes and he awkwardly leans his body into hers, I feel they were meant for each other. She gracefully licks him to redirect the occasional harsh strokes that Eric delivers, and does so with the patience of a new mother with her child.

For several years now we have watched our eight-year-old son Eric interact with dogs. Although Eric's special needs have left him severely physically and cognitively delayed, the reaction towards Eric that we've seen elicited from some of our friends' dogs is unique. We have watched several different dogs lay next to Eric in an unusually protective way, as if they can sense his vulnerability.

As we saw these interactions repeatedly occur we debated whether we should get a dog. We hesitated for all the typical reasons that you might guess. What would we do with the dog when we went on vacation? What about all that dog hair in the house? Dogs jump on people. Dogs bark and chase squirrels.

Well…right now, this very minute…Bethany is lying in Eric's room "hanging out" with him. You see, she's the only one in the family that has time to do just that. My husband is working, my daughter is cleaning her room, and I'm pretending to be a writer. Don't get me wrong; we love spending time with Eric. It's just that the demands of life keep us very busy. It's comforting to know that Eric has a big, warm, furry body there to nuzzle up to when he feels like it. Bethany allows him to be Eric. She doesn't mind that he makes loud noises, or that his body won't let him move the way he wants it to move. She doesn't care that he drools sometimes and that his touch can be kind of rough. But I think she does sense that his heart is kind, gentle and pure—just like hers, and that he would never hurt her. This gift came from the people at CCI.

It's impossible for me to describe the day in which placements occurred. Eight nervous families were standing in the training arena waiting to be placed with their dogs. Although CCI instructors repeatedly remind you not to get emotionally attached to a particular dog, it was impossible for me not to do so. To be honest, I loved Bethany so much by the second day, I felt I was losing my objectivity and begged for a different dog. I couldn't sleep at night without dreaming about dogs. And trust me, I was not a dog person.

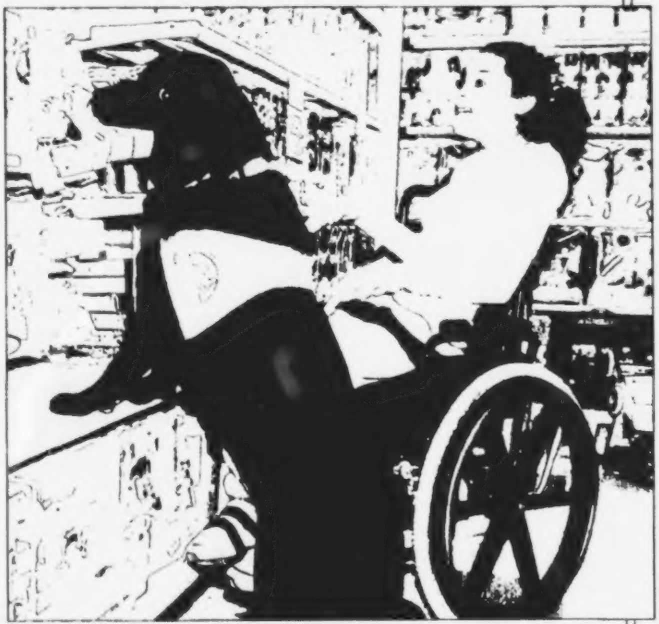
Before placements occurred, we were alerted that other people might be joining us that day. It was true. There are many people who are involved with this organization who love to see the moment when the dogs are placed with their recipients. CCI employees came out of their offices, financial donors came to watch, as did puppy raisers, and even one of CCI's veterinarians. When Bethany was placed with Eric, tears spilled from my eyes. Not only was I grateful to our exceptional instructors, but I realized that the grace of Bethany was the joint effort of many outstanding individuals.

Bethany had been born and bred in California, placed with loving puppy raisers, then shipped to Ohio for advanced training with her outstanding dog trainer. She then was placed with our severely handicapped child. What a gift of love Bethany is. She is a product of the culminated efforts of so many good-hearted individuals. Those individuals will probably never realize what good work they do, or how their efforts positively affect so many individuals who can't always express what their hearts are feeling. But I know, as a parent of a "special" child, that their efforts mean the world to one little boy…our son, Eric.

ner. Service dogs will pull their partner in a manual wheelchair, flip light switches, push buttons for elevators, open refrigerators, retrieve dropped objects, and assist with business transactions by referring money, receipts and packages. Service dogs perform the tasks that enable their partners to experience the independence of having a trained canine perform jobs that had previously been done by other people. They aid in the quality of life of their human partners.

Hearing Dogs. These dogs work with adults who are deaf or hard of hearing and are trained to alert their partners to particular sounds by making physical contact with them. The ring of a doorbell, cry of a baby, knock at the door, alarm clock, intruder, call of a name and smoke alarm are all sounds that will trigger a response in the dogs. These hearing dogs bring a sense of security and confidence to the human partners they protect.

Facility Dogs. What separates these dogs from the others is the fact that they are not permanently placed with a special needs person. Facility dogs are trained to work with a facilitator-handler who is able-bodied and who works or volunteers in settings such as hospitals, extended care facilities, physical therapy programs, hospices, special education classrooms, and programs for people with developmental disabilities. These dogs offer patients opportunities for physical activity, as in throwing a ball for the dog or building strength in grooming sessions. These dogs, in their companionship, unconditional love and attention, give these patients added motivation to participate actively in their recovery process.



Allison and her dog Twilight make a great team.

Skilled Companion Dog. These dogs are trained to work with an

Assistance Dog Goes Hollywood

Sue Thomas and her hearing-ear dog Levi are solving crimes and hooking viewers on Pax TV's new show "Sue Thomas: F.B.Eye."

Based on the true-life story of Sue Thomas, the show follows her experiences with the FBI in Washington, D.C. The opening episode begins as Sue, who has been deaf since early childhood, leaves her parents' home in Ohio for the first time to begin her new life and career for the Bureau. She stops and picks up her hearing-eye dog Levi along her way and the two immediately bond.

Sue soon impresses her co-workers with her ability to read lips and is quickly promoted to a position where her skills are used to crack crimes in places where listening devices can not penetrate. Levi is her constant companion and best friend who aids and supports her through every case.

Sue Thomas herself is extremely pleased with the direction that the show has taken. As she explains, "this series is making history. It is the first to bring these worlds together on television in such a powerful and positive way." The show is groundbreaking as never before has there been a television series that was based on deafness with an actor who was deaf.

However, F.B.Eye is not the only television series depicting a challenged character this season. Daryl "Chill" Mitchell, who had a recent accident that placed him in a wheelchair, is a series regular on "Ed;" Marlee Matlin, who is deaf, has a recurring role on "The West Wing," and many other people with disabilities are being featured on television in the growing willingness of the business to portray these individuals.

Sue Thomas also mentioned her happiness in the depiction of Levi. She explains, "you couldn't tell my story without having Levi- he's my ears!" The real life crime-fighter went further to comment on her definite approval of the golden retriever chosen to be her friend Levi; Jesse. "Jesse, the golden retriever who portrays Levi, is everything I could ask for and more…take a look into those eyes and you'll find the love, trust, and security of your best friend. I look forward to the day when I am no longer asked that common question, "What's a hearing dog-what do they do?"

Sue Thomas F.B.Eye airs Sundays at 9:00-10:00p.m. (ET/PT) (CC).

continued from page 39

adult or a child with a disability as well as a second individual. This second individual is most often a caregiver, spouse, or parent who serves as the facilitator in handling and caring for the assistance dog. Both the recipient and the facilitator attend the two-week Team Training session. Like service dogs, Skilled Companion Dogs perform tasks that their disabled partner can not. They are helpful in a great number of tasks that are common to every day living.

Dogs have been documented to have saved the lives of humans on physical and emotional levels throughout time. They are our eternal and unconditional best friends. Assistance dogs reach further because they are needed in a larger sense. Adults and children with disabilities could and do survive without them, but many are realizing the reasons why they don't need to. EP

College Bound

When Brandon first came to Heartspring School, his goals were simple: learn to ride a bike, improve gross motor skills, and control aggressive behaviors. Now he has bigger ideas: bowling, computers, tennis, golf ... and choosing a college. Yes, Brandon will graduate from high school this May and embark on an extraordinary new stage in his life. Goes to show what's possible with the right kind of help—even when you have Asperger's Syndrome.

FAMILY DYNAMICS

IN THE TREATMENT OF TOURETTE SYNDROME

Lynne Rosen, CSW

While there have been great scientific advances made in the treatment of Tourette Syndrome (TS), including better medications that target the most debilitating symptoms, many children suffering from this disorder must still deal with the daily onslaught of teasing and ridicule from their peers.

People are often both intrigued and horrified when witnessing the stream of strange sounds and movements associated with TS. Educating the public can have tremendous value by lessening the stigma. However, all the education in the world provides little comfort to a child who comes home from school demoralized and defeated, not knowing how to best handle peer reaction that ranges from curiosity at best to cruel taunting and ostracism at worst. Therapy can help children to respond more effectively to their peers. When children take charge of the situation, their sense of identity and resolve is strengthened resulting in a surge of self-esteem.

For all children, self-esteem stems from successfully mastering developmental challenges and taking new initiatives, and requires energy to do so. However, children with TS must contend with both internal and external forces beyond what their peers must face. They may expend endless amounts of energy not only on suppressing their tics in the presence of others, but also on struggling to develop a positive self image in the face of negative feedback from their environment.

These children do not have to passively absorb such negative feedback. This is where the family can play a major role by helping the child to fight against those detrimental forces that threaten to undermine his stability.

Good therapy should be geared toward helping children and their families to view TS in a different light. Rather than seeing it as a "punishment" or a "handicap," it can be seen as an opportunity to tackle a difficult challenge, that when mastered, results in the development of a more solid sense of self. This hard-earned competence comes from knowing that the child has overcome a major personal life obstacle. Ultimately, it can fuel determination to succeed no matter what further obstacles lie ahead.

Although Tourette Syndrome poses major challenges to a child's functioning, it can also serve to mask underlying conflicts in the family that may have lingered for years. Parents who seek treatment for a child with TS may become fixated on the child's distressing symptoms while ignoring other significant issues. Therefore it is important for the therapist to carefully assess whether TS is indeed the main problem or whether it may be conveniently camouflaging painful conflicts in the family.

If the latter is the case, then at the outset of treatment, the therapist must begin to sift through the complex family dynamics and determine where there are openings to make positive, new changes. The goal is to foster a gradual shift away from the exclusive focus on TS and toward a deeper understanding of how family members may be interacting in harmful and destructive ways. I have found that this often results in a reduction of TS symptoms as well as a strengthening of the family's foundation.

One particular case comes to mind of an eleven-year-old girl I'll call Lydia. Lydia had been recently diagnosed with TS, and was beginning to reckon with uncontrollable eye blinking and high pitched barking noises that escaped from her mouth during her classes at school. At those moments, tense laughter permeated the room and Lydia desperately wanted to disappear. She often found refuge in the girl's bathroom where she would stare at herself in the mirror wondering why this awful thing was happening to her and not the other kids. Despite her winning, charming personality and careful attention to her appearance, Lydia began to see herself as a "total misfit."

Lydia's mother had already read much literature on the topic and had a fairly good grasp on the fact that this was a neurological disorder in which the severity of the symptoms fluctuated over time. While she sincerely encouraged Lydia to overcome the negative effects of her condition by achieving new goals, part of her was mired in anger over seeing her daughter as being stuck with a condition that was out of her control.

> DURING ONE PARTICULAR SESSION WITH LYDIA I SEIZED UPON AN OPPORTUNITY TO BREAK THE DEADLOCK. LYDIA PLOPPED DOWN ON THE CHAIR AND STARED AT ME SULLENLY FOR SEVERAL MOMENTS. WHEN I ASKED HER WHAT WAS WRONG, SHE GAZED UP AT ME WITH HER PIERCING BLUE EYES AND SAID "MS. ROSEN, WHY CAN'T I JUST BE NORMAL?"

The key word here is "control." We know that children cannot completely control their tics anymore than their parents can control all the hostile reactions from the world. However, this does not have to lead to the sense of helplessness and futility to which Lydia's mother had become a prisoner. In sessions, while she intellectually spoke about the ways in which Lydia could better manage her TS, she emotionally was a wreck. She spent many sleepless nights imagining Lydia's future; one dominated by frustration and hardship over all the unfair treatment that she would experience. She also had periods where she would lapse into self-pity thinking "why did this happen to my child?" This behavior is strikingly similar to what Lydia displayed in the girl's bathroom at school.

Children model ways of functioning and coping from their parents. Unfortunately, some modeling can be destructive to a child's well being. Once these destructive patterns have become firmly established, they can chip away at all the positive strides children with TS attempt to make to combat their condition. The therapist can help the family to identify and get a grip on these negative patterns and eliminate them from their repertoire of functioning.

On one hand, Lydia's mother made sure that Lydia was involved in extra-curricular activities. She never hesitated to drive Lydia to her music lessons and other activities and encourage her to stick with them. As a result, Lydia began standing out from her peers and winning competitions. Yet the problem was that she was unable to experience the full glory of these accomplishments because of the self-defeating behavior she had adopted from her mother. This left her vulnerable to outside attacks that tore away at the good feeling she had worked so hard to build up.

The final blow came during a math exam at school. Lydia had been working vigorously to raise her "B+" average in math to an "A." Math had become her obsession. It was almost as if acing this exam would be another symbolic victory over her TS. It is important to continually encourage these children to fight against discrimination with achievement. However, as Lydia began to dissect the difficult equations, she grew increasingly nervous. With

continued on page 44

Family & Community

continued from page 43

each stroke of the pen, her tics grew louder, until finally one of her classmates jumped up from this seat saying "can you shut the hell up already, you freak!" Lydia fled the classroom in tears. When her teacher ran out to the hall to console her Lydia dropped to the floor and shouted "There's no point...why do I bother trying?"

Following this incident, both mother and daughter fell into a funk. Waves of negativity filled my office for the next several sessions. At that point, I stepped in as the voice of reason by compassionately but firmly pointing out to Lydia's mother that TS was not to blame for all of Lydia's problems. While the therapist must certainly empathize with the unique challenges the TS child faces, she must also help the child and other family members if necessary to develop a "thicker skin" when it comes to facing their own difficulties unrelated to TS.

In Lydia's case, mother and daughter had become deadlocked. They were embroiled in a highly reactive, volatile pattern of relating where both repeatedly fed on the other's insecurities. Their collective strengths were not surfacing, but instead had become swallowed up by a mixture of emotions that included guilt, sadness and anger. I want to note that these feelings were not only connected to TS, but also stemmed from the mother's ineffective handling of her own lifelong struggle with low self-esteem. She had been attempting to bolster her esteem by being a good parent. While this was a step in the right direction, when anything outside of her "control" (i.e. TS) interfered with her efforts, she felt crushed and overwhelmed.

During one particular session with Lydia I seized upon an opportunity to break the deadlock. Lydia plopped down on the chair and stared at me sullenly for several moments. When I asked her what was wrong, she gazed up at me with her piercing blue eyes and said "Ms. Rosen, why can't I just be normal?"

I told Lydia that she might have this condition for the rest of her life, but that it did not have to stop her from living. Lydia immediately responded in a desperate voice, "But that boy called me a freak."

I then asked her if she really believed she was a freak. Lydia hesitated a moment and then calmly said, "No... but."

"But what?" I interrupted.

"But my mom cries a lot about it," Lydia said.

When I asked her how she felt when her mother does that, she said, "Mad...I just want her to stop." I then asked her if she ever told her mother to stop.

"No, because she seems so sad," she responded.

And when I asked Lydia if she thought that was because of her, she twisted her hair nervously and replied with a "no." I then told Lydia it did not matter how the other kids reacted to her tics as long as she strove for her best. She smiled as she left my office.

The following week her mother requested to see me individually. She told me that she realized it was not only Lydia who needed help. She then related how one day Lydia came home from school and told her that the same boy from the test had picked on her for her condition again. But the story continued when Lydia said, "Don't worry mommy...I told him to shut up and worry more about failing math," as soon as she saw her mother begin to get upset. Her mom began to sob, saying, "I wish I had half the self-esteem Lydia has."

I pointed out to her that she could begin to build real self-esteem by managing her emotions better and finding new ways to fuel her own self-confidence. This session marked an important turning point for the family, one in which a mother finally took responsibility for herself. Once Lydia stood up to her tormentor, her mother could no longer use TS as a reason for not facing her own psychological issues.

During our final sessions, much tension eased between Lydia and her mother. Of course, sometimes there still are arguments that center on Lydia's growing independence. However, mother and daughter had begun to feed more off of each other's energy. Lydia was now more prepared to weather any teasing that came her way. Treatment ended on both with a note of optimism and caution. I reminded Lydia's mother that while she had taken a positive step, this was only the beginning and that she needed to work on improving herself, otherwise she would not be able to keep up with Lydia's progress. She told me she understood this and had decided to seek individual therapy to support her with the changes that she needed to make.

This case demonstrates the value of insight oriented therapy in addressing the effects of TS from an individual, family and social perspective. It can lead to more effective management of TS symptoms as well as greater self-confidence and a sense of resolve. **EP**

SIGNING FOR SUCCESS

By Abbey Woodard

Bradley Woodard signing "Mommy".

For most parents, your child's first word is an extremely joyful time in your life. He is finally changing from a baby into a little person, who is capable of expressing his wants and needs, and later his thoughts and feelings. But if your child has a speech delay this potentially joyful time can be an extremely sad and frustrating ordeal. Instead of a child who is happily babbling and uttering the occasional spoken word, you have a frustrated toddler who screams and cries because he cannot understand why you do not know that he wants something as simple as juice instead of milk.

I have been in this situation. I have a son, Bradley, who has Down syndrome and has a speech delay because of this diagnosis. Due to a developmental speech delay that children with Down syndrome have, and other problems such as low muscle tone, he was unable to talk when other children his age began speaking. This was an extremely difficult time in both of our lives. Bradley was frustrated because he could not tell what he wanted, and I was frustrated because it seemed that all he did was scream. Then one day at a therapy session, Bradley's speech therapist suggested teaching him signs.

Having learned sign language as a child, because of a friend with hearing impairment, I was immediately receptive to the idea. I started out with teaching Bradley one sign "eat." I figured that this was a crucial sign that would help ease some of his frustration. Every time I spoke the word "eat" while Bradley was sitting in his highchair, I would also use the sign. The first few times I did this he looked at me as if I were crazy, then in a few weeks he started catching on. Then one joyous day, when he was throwing one of his temper tantrums, I asked him what he wanted and he stopped, wiped the tears from his eyes, and signed, "eat." I was delighted! My baby could talk!

With the word "eat" having

continued on page 46

Abbie Woodard with her son Bradley, who uses sign language to communicate.

continued from page 45

been mastered, I began to teach him other simple signs that he would need to communicate such as "drink," "cookie," "night-night" etc. Before long, Bradley was learning signs in no time. Now at the age of three, he has a signing vocabulary that consists of over 200 signs. His signs include everything from different types of foods to names of animals to even colors. This child who, at one time spent much of his time screaming and crying, was now pointing out pictures in books and showing me the signs.

One of my first questions to my son's speech pathologist was does the use of signs initially instead of words delay speech? The answer to that question is "No." The use of signs only allows a child that is not talking an avenue to express himself. My son is now at the point that he will try to speak a word and if I do not understand him, he will then use his sign as backup.

Sign language books for children can be purchased at a local bookstore or checked out at a local library. I recommend a children's sign language book opposed to an American Sign Language dictionary because a children's sign language book will have signs more often used by children, whereas an American Sign Language dictionary is more complex and contains many signs and a structure of signing that you will not use.

Due to emerging fine motor skills in young children, the signs that children produce may sometimes vary from the original sign. This is fine. Your child is not trying to become an interpreter of American Sign Language. He is simply trying to communicate. Any sign that he shall make and use consistently to mean a certain thing will be fine. As long as you, and the others involved in his life understand him, the goal is achieved.

The use of sign language will not correct your child's inability to talk but it will tremendously ease the frustration of not being able to communicate. The key element in this process is patience. In the beginning, it takes some time for your child to "catch on" to what you are doing. It also takes repetition. But I guarantee you that the time and patience spent using this technique with your child will, in the long run, make the quality of life during those first tedious non-talking months or years better for the both of you. She plans on receiving her Master's degree in Speech and Language Pathology.

EARLY INTERVENTION SERVICES:

A FAMILY-PROFESSIONAL PARTNERSHIP

Family & Community

By Carolyn Cantu, MS, OTR

"Your child may experience developmental delays." The shock of hearing that prognosis from the neonatologist or pediatrician is numbing. Some parents receive this news at the birth of their child, along with a diagnosis. Some notice milestones are not being met as their child develops. Either way, the initial trauma and emotional adjustment create sometimes-overwhelming feelings of guilt, anger, blame and depression. Questions race through parents' minds as they grapple with "What are we to expect? How can we help now? How will we ever afford the cost of treatments?" and most important, "Who will help us?"

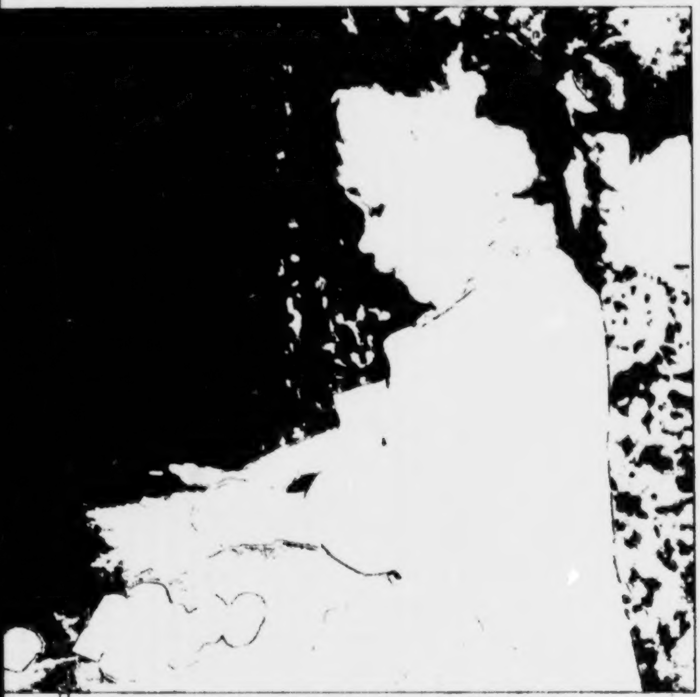
Help for children and their families does exist, through early intervention programs nationwide. Early intervention programs are devoted to enhancing development, minimizing developmental delays and providing instruction, support and assistance to those children and their families. This commitment is ongoing.

HISTORY OF EARLY INTERVENTION PROGRAMS

The Education for All Handicapped Children Act of 1975 initiated the course of action for early intervention programs and future legislation. By 1986, Congress established the Part H program for infants (aged zero to two years) and toddlers (aged three to five years). The legislation was considered momentous because it promised to provide services to all young children and their families. Research compiled by the mid 1980's strengthened the proposal considerably, suggesting significant progress in young children with disabilities who had received early intervention services. Cost-effectiveness figures were impressive enough to extend "free and appropriate education" to three- to five-year olds with disabilities. The states were now required to designate the most appropriate agency to determine services for that young population.

Gradually, as the legislation was applied nationwide, attention began to transfer from the individual child toward care of the child and family receiving care. Consequently, an

continued on page 48



Showing bilateral integration, this little girl uses both sides of her body to engage in coloring her box with chalk.

continued from page 47

inclusive, holistic approach was implemented in early childhood programs across the country, requiring fourteen components within each state system. Part H defined developmental delays, delineated eligibility and required execution of a multi-disciplinary evaluation of each eligible child, development of an individualized plan of intervention for the child and the family and a timetable to ensure services. The integrated approach toward child and family care was well underway.

Additional legislation honed these concepts. In 1997, Part C of the Individuals with Disabilities Education Act (IDEA '97) focused on the services provided for young children with disabilities. Congress stipulated that there was an "urgent and substantial need to enhance the development of infants and toddlers with disabilities and minimize their potential for developmental delay." It is in Part C that "services are required to be provided in the child's natural environment to the maximum extent possible." The law went on to emphasize the role of families in intervention "to enhance the capacity of families and the special needs of their infants and toddlers with disabilities." Developmental areas of concern and qualified personnel are clearly defined.

FAMILY CENTERED INTERVENTION

Although differences in names, service guidelines, policies and procedures occur state to state, early intervention service programs are presently designed to work in partnership with families. The purpose and practice is truly a collaboration of support and skills as parents and professionals work toward common goals. This is why families are considered a vital part of the Individual Family Service Plan (IFSP), for children aged zero to three years, then of the Individual Education Plan (IEP). These plans are the product of a cooperative effort between family and staff. Initially, the IFSP/IEP states the child's present level of functioning, parents' priorities, concerns, and the family's resources.

Based on assessment results, goals are set by families with guidance from the professional team, which may include therapists, teachers, social services and early-childhood specialists. During the development of the IFSP/IEP, parents or guardians actively participate in establishing priorities, goals and strategies to develop their child's strengths and minimize their limitations.

"What do you want to see your child doing at this stage?" may be a typical question to parents. Usually, achieving developmental advances is of primary importance. At this point in the process, a realistic time frame is usually established. It is at this planning meeting that additional needs of the family are also discussed: perhaps they need assistance with establishing respite care, or with time management, or exploring local day care. The IFSP/IEP covers all those needs and concerns by establishing a set of strategies to address each issue.

Setting goals and strategies is not enough in this holistic approach to family care. In 1993 Brown, Thurman and Pearl, in Family Centered Intervention with Infants and Toddlers, addressed the importance of considering the variety of family units as vital in reaching successful intervention. Early childhood professionals make every effort to demonstrate sensitivity to racial, ethnic and cultural diversities. Personnel typically honor these differences in their approach to every single family. The personalities of parents and siblings are also seriously considered. Reactions, strengths and limitations of each family member influence the expectations each has of one another. Understanding and using the varied ways of coping may enhance the child's progress.

The pivotal element of family-centered care is the recognition that the family is constant and the intervention setting is temporary. The role of the early intervention provider is to support, teach, and assist the family in promoting life skills and reducing delays. Family members are the hour-to-hour, day-to-day therapists and teachers. They reinforce language, behavior training, feeding, positioning, sensory input, and movement techniques. They read with their children, build from blocks with them, match colors, sort and encourage language. They are the most important, consistent people in their child's life and are most responsible for their child's progress.

Because parents and other family members are so important in the execution of the individualized plan, early intervention programs strive to accommodate the family's home environment, community and schedule as much as possible. It is not uncommon for a therapist to visit the child in the home with the family one week and at the day-care center with its staff the next.

In this way, both family and day-care providers benefit from the therapist's instruction, demonstration and suggestions. One reinforces the other and the child benefits from intervention no matter where s/he is during the day. The professional intervention team will be a part of the family's life for up to three years. Eventually, however, the child moves on. At three years old s/he is off to another early childhood program. The professionals who work with the child change but the family remains constant.

ECI: FROM REFERRAL TO TRANSITION

Initial awareness of a local program usually comes from the family physician, pediatrician, neurologist or hospital staff, or a family member may do research on the state's Early Childhood Programs or Early Childhood Intervention Service websites. Parents, family members, physicians or clinics may refer a child to a local program. There is no waiting list. Most, though not all, programs stipulate that the child must be seen within 45 days of the referral call. Each program has its own progression. Generally, after the initial screening/intake, a team of professionals—either an OT or PT, a teacher, speech pathologist, nutritionist and social worker—executes a formal assessment.

This assessment and future service take place in the child's "most natural environment to the maximum extent appropriate," that is, the place where the child spends most of the day. This may be the child's home, the home of a caregiver or a day-care center. When the child turns three years old, s/he "graduates" to the next-level program. This might be a school district's early childhood center, a day-care center, a private preschool, private therapy or continued care at home until legal school age.

Part C of IDEA lists the qualified personnel of the intervention team: special educators, speech and language pathologists, audiologists, occupational and physical therapists, social workers, nurses, nutritionists, family therapists, orientation and mobility specialists and pediatricians and other physicians. Licensed, certified professionals and paraprofessionals staff early intervention programs. All specialize in the development of young children. These are the

individuals who provide assessment, intervention, reassessment and transition services for the child until his/her third birthday.

HOW PROGRAMS ARE FUNDED

As stated in IDEA '97, funds for assessments and visits by the early intervention staff come from the state and federal governments, with grant money as possible supplemental funding; thus, there is no cost to individual families. Private insurance may be billed if the family so wishes, and ECI programs are required to bill Medicaid and CHIP for services.

NEW LEGISLATION

There is reason to expect that the 2003 Reauthorization of IDEA will reinforce the collaboration of families and professionals. It is not a new concept that when children are diagnosed with disabilities or developmental delays, they depend on family for more support. Families are the first and most constant source of nurture, strength, help and education for their children, especially those with special needs.

Monumental as it is, the task facing families is shared by early intervention service programs. These programs strive to achieve common goals with their family partners while maintaining a high standard of care. Parents first learning of their child's developmental delays will find help by connecting with their state early intervention service. That initial communication will put the family in contact with their local program and intervention will begin at no cost. Legally sanctioned, these programs impart appropriate intervention to developing infants and young children while providing attention, support, and education to their families. EP

A PEDIATRICIAN'S TREATMENT FOR HER DAUGHTER

PART 2 • BY JO FEINGOLD, MD

In the November 2002 issue of EP, Dr. Feingold talked about her five children. Elisa is her second child and was born with a neurological disorder that caused significant developmental delays. Despite the multiple therapies she received, Elisa's condition showed little improvement. When a relative suggested that Elisa might benefit from hyperbaric oxygenation therapy (HBOT) Dr. Feingold disdained it. In her own opinion and that of neurologists she consulted, HBOT therapy for CP and related disorders was considered to be quackery. This article explains how and why Dr. Feingold changed her mind and became an HBOT supporter.

The hardest thing about having a child with special needs is being able to be a mother to all my children without having any of them resent Elisa for being different and still being able to provide for her as if she were an only child.

HYPERBARIC OXYGEN THERAPY

Three years later, when I started to network with other families, I heard of a study about hyperbaric oxygen therapy going on at Cornell University Medical School and enrolled my daughter. She received her first 40 treatments in December 1999. Now, my physician training comes into play. I am acutely cognizant of all the theories..."the placebo effect"..."the positive reinforcement of having your parents in the chamber with you"...etc., etc. While Elisa was being treated, I felt as if she was waking up. She was able to say about 35 words then. She was not toilet trained. She was unable to watch any children's TV programs. She said "mik" when she was thirsty and screamed when she was hungry.

The first major change I saw occurred during the first week of treatments. She turned to me and said "booscoos." I had no idea what she was trying to say. The mother who was in the chamber with me said that she thought Elisa wanted to watch "Blue's Clues." I told her that Elisa didn't watch tapes; she told me her son was watching it earlier, so maybe Elisa had seen it. We put the tape on and my daughter remained glued to the monitor for the next 45 minutes. I was the highly trained physician, the one with all the knowledge. How little I knew!

Over the next few weeks Elisa started to talk. Three months later in the supermarket, I realized she was naming everything she saw. Almost instantly I realized that I was wrong; I wasn't doing everything I could for my daughter. I took a second mortgage on my house and bought a hyperbaric oxygen chamber so I could continue to treat Elisa close to home—and I could treat other children as well. Elisa has made incredible progress over these past two years. She is alert; she laughs and plays with her brothers and sisters and is otherwise a beautiful child.

About six months ago I decided to send my daughter to Hungary for conductive education at the Peto Institute. We needed to obtain a passport for her. We waited for hours in the waiting area. Elisa started talking to a woman who was going to France and waiting for her passport. I was shocked at how well Elisa was able to communicate with her. When the woman did not understand her, my daughter repeated herself and rephrased what she wanted to say until she was understood. I realized that although her little body is so spastic and unable to do what she wants, she has an incredible ability to communicate with people. She makes herself heard and understood. And that was the most important thing I could give her.

People tell me I was gutsy for putting everything we owned into the hyperbaric oxygen center we now operate. I say that I only did what any other mother would do. What I did was to ignore what my training had instilled in me and reverted to the Hippocratic Oath I took as a physician: to "first do no harm; then treat until treatments are no longer effective." I know that there are no valid randomized double-blind clinical trials that support the efficacy of hyperbaric oxygen therapy in people with cerebral palsy. I also have seen first-hand how patients improve from its use. Essentially, I saw something that worked for my child and did everything I could to make sure she had all that she needed to help her thrive and grow.

continued on page 52

> **...the most important lesson I learned...came from my first-born. She said "Don't you understand, mommy? We're all different on the outside but inside we are all made the same. Treat Elisa just like us."**

continued from page 51

The hardest thing about having a child with special needs is being able to be a mother to all my children without having any of them resent Elisa for being different and still being able to provide for her as if she were an only child. Some days I do better than others. I still have days in which I am depressed and fall into despair. There are the dark days in which I ask myself if it was too much to ask to have five normal children, and why did God give me this burden to bear? There are days in which I ask myself how long my strength will hold up, how long I will be able to carry her. But I realize that these are fleeting moments and wasteful self-pity. Most days I feel privileged to be a mother. I feel good about being able to provide HBOT therapy to others. I love to see children gradually change and grow.

I have learned to appreciate what it means to be the parent of a special needs child...because I never learned this in medical school. I never knew about chronic disabilities in medical school and all that I learned about them, I realized, I had learned from parents. I learn every day as a physician , but mostly as a mother. In fact, the most important lesson I learned did not come from a textbook; it came from my first-born. She complained that she thought that I was not treating all my children the same. I naturally thought that what she meant was that Elisa was getting preferential treatment—but I was wrong. She thought I was singling Elisa out. She said "Don't you understand, mommy? We're all different on the outside but inside we are all made the same. Treat Elisa just like us."

Sometimes if we keep our minds and hearts open and we listen carefully, our children can teach us much. I am a mother and a physician most richly blessed! EP

Wraparound Mental Health Services

QUESTIONS AND ANSWERS

Stephen J. Bugaj, EdD, Randall L. Manning and Renee Brunner

While this article was written primarily for Pennsylvania residents, wraparound services are available in many states. Contact your state department of mental health for information in your area.

WHAT ARE WRAPAROUND SERVICES?

The term *wraparound* is used to designate several mental health (MH) services provided to children in their homes, school, or in the community. In essence, these services "wrap around" a child and help to avoid unnecessary out-of-home placements or hospitalization. Wraparound services have been available in Pennsylvania for some time, yet many parents have never heard of them and have no idea how to obtain them for their child.

WHAT SPECIFIC MENTAL HEALTH SERVICES ARE AVAILABLE THROUGH WRAPAROUND?

The wraparound mental health services used most frequently include therapeutic staff support (TSS), mobile therapy (MT) and behavioral specialist consultation (BSC).

Therapeutic staff support is one-on-one intervention by a trained person with a specific student in order to modify symptomatic behaviors. It might include crisis intervention, immediate behavioral reinforcement, re-direction, role-playing and consequence strategies. The purpose of TSS is to increase the sense of responsibility and age-appropriate behaviors of the student and to promote the student's problem-solving and self-sufficiency skills.

Mobile therapy is individual and family psychotherapy. However, the format for delivery of this service varies according to the individual needs of the student. Critical elements of mobile therapy include active listening, treatment planning and exchanging information with the student and family.

Behavioral specialist consultation involves assessment, program design and student monitoring, rather than direct therapy. A behavioral specialist designs a behavioral plan that incorporates non-aversive methods and can be implemented on-site by a TSS person.

WHAT ARE THE QUALIFICATIONS OF THE INDIVIDUALS WHO PROVIDE WRAPAROUND?

TSS people are required to have a bachelor's degree in a human-services field and training in crisis intervention. Other levels of education can be accepted contingent upon experience. Mobile therapists are licensed mental-health professionals or individuals with graduate degrees in mental health who have experience in implementing MH services. Behavioral specialists are often licensed doctoral-level psychologists or graduate-level clinicians skilled in behavior modification.

I LIVE IN RURAL PENNSYLVANIA. ARE THE SAME SERVICES AVAILABLE TO MY CHILD THAT MIGHT BE AVAILABLE ELSEWHERE?

Not necessarily. Wraparound is largely dependent on the number of local service providers and trained individuals available to provide the services. Consequently, rural areas may not have the same availability of wraparound as larger communities.

WHERE CAN THESE SERVICES BE PROVIDED? FOR EXAMPLE, WHAT IF MY CHILD NEEDS THEM WHILE HE IS IN SCHOOL?

Wraparound services can be provided in almost any setting where the child's behaviors are preventing normal functioning. In the public schools, TSS, MT and BSC are readily available. TSS may even be available on the school bus, should the student require it.

MUST I PAY FOR ANY OF THESE SERVICES?

No. Wraparound in Pennsylvania is covered by Medical Assistance (MA). As each child must have a mental health diagnosis to receive these services, s/he is eligible to receive an individual MA card regardless of parental income. The use of the MA card will not affect any insurance coverage that parents may have.

IS IT TRUE THAT WRAPAROUND SERVICES ARE BEING CUT AND PARENTAL INCOME IS GOING TO BE CONSIDERED BEFORE AUTHORIZING THEM?

No. While the Department of Public Welfare in Pennsylvania recently drafted a document suggesting these very changes, the Pennsylvania State Legislature passed a budget on June 2, 2002 that appears to have denied this income cap.

MUST MY CHILD HAVE AN IEP IN ORDER TO GET WRAPAROUND?

No. Wraparound services are available to more students than just those served by the special education system. While students identified as seri-

continued on page 54

continued from page 53

ously emotionally disturbed under IDEA are eligible to receive wraparound, so, too, are students who are at risk of developing emotional problems.

MUST MY CHILD BE LABELED IN ORDER TO GET THESE SERVICES?

No. The evaluation process and the criteria required for eligibility are less formalized with wraparound. A psycho-educational evaluation of the student is not required; rather, a psychiatrist or licensed psychologist must recommend that the services are medically necessary for the student, and the Child and Adolescent Service System Program (CASSP) team must determine that the services are required.

EXACTLY HOW DO I GO ABOUT GETTING WRAPAROUND FOR MY CHILD? IS THERE MUCH RED TAPE INVOLVED?

All requests for wraparound services must go through the CASSP team. Under the direction of a CASSP coordinator, an interagency team of parents, community agencies, local service providers and school personnel develops an individual treatment plan that authorizes MH services for a designated period of time for a specific child.

DO I HAVE ANY SAY IN DETERMINING THE SELECTION OF SERVICES FOR MY CHILD?

Absolutely. Parents are full participants in the CASSP process. In fact, the CASSP team may not even proceed unless the parent attends the meeting. Parents also have the final choice of local service provider should several be available. On the negative side, students who are 14 years of age and older may legitimately refuse to take part in these services regardless of the recommendations of the CASSP team or the wishes of the parent.

WHAT IF MY CHILD NEEDS MORE THAN ONE WRAPAROUND SERVICE?

Depending on the needs of the child, several wraparound services might be implemented. For example, it is common for a student to receive TSS at school and MT at home.

HOW SOON AFTER THE CASSP MEETING CAN I EXPECT THESE SERVICES TO BEGIN?

It depends. As noted above, the availability of wraparound is often contingent upon having trained individuals to provide the service. Consequently, there may be delays of several weeks or longer between the CASSP Team meeting and the actual delivery of the service. Typically, TSS takes the longest time because the state must review each case and authorize services prior to their provision. If staff is available, TSS should be provided within 60 days from the date of the request.

WHAT IF THERE ARE DELAYS IN GETTING THESE SERVICES STARTED?

In areas served by more than one service provider, delays in beginning wraparound may be addressed by selecting the provider who has trained staff available. Should delays occur in delivering TSS in the school, the CASSP Team may consider asking the school district to assign a teacher aide to the child on a temporary basis and only until wraparound begins. Such a consideration must be done with full cooperation of the local school district.

As MT and BSC do not require prior authorization from the state, these services can begin almost immediately. Should delays be encountered in implementing TSS, MTs and/or BSs can assist the teacher aide in providing interventions until a regular TSS is assigned.

HOW LONG MAY MY CHILD RECEIVE THESE SERVICES?

One of the main components of wraparound is to transfer these skills to parents, teachers and other caregivers so that children can be maintained in their natural settings without the presence of wraparound staff. So, unlike special education and related services made available under IDEA, wraparound is designed to be of short duration and may only be available for an abbreviated period of time.

WHAT HAPPENS IF MY CHILD STILL NEEDS THESE SERVICES AND THEY ARE NO LONGER AVAILABLE? OR WHAT IF THE CASSP TEAM DETERMINES MY CHILD IS NO LONGER CONSIDERED ELIGIBLE FOR WRAPAROUND?

Routinely, the child is re-evaluated every four months to determine if wraparound is still appropriate. Before the termination of any wraparound service, the service provider should reduce the frequency and length of sessions over a period of time to allow for behavioral improvements to occur in more normalized situations.

In situations where long-term assistance is required in the school and is not authorized by the service provider, the school district may again need to consider assigning a teacher aide or paraprofessional to the student. Before this occurs, it is important that the service provider and district ensure that the aide is properly trained to deliver the same type of MH services as was done previously by the TSS.

WHAT HAPPENS IF THESE SERVICES DON'T WORK? WHAT ELSE CAN BE DONE?

The CASSP Team should reconvene and address the child's needs. The current level of service might need to be increased, or additional wraparound services may be required.

WHAT IF I AM UNHAPPY WITH THESE SERVICES? WHAT ARE MY RIGHTS?

Medical Assistance suggests that parents share such concerns with the agency providing the service first. Should this step prove to be insufficient, parents should contact the county Mental Health Administrator. A phone number should be included as part of the paperwork related to the student's situation.

WHAT HELP MIGHT THERE BE SO THAT I CAN UNDERSTAND THE SYSTEM AND ACCESS WRAPAROUND FOR MY CHILD?

The local county Mental Health Office can provide parents with more information on wraparound and the CASSP Team process. Additional assistance may be obtained through intensive case management (ICM), which helps parents acquire needed medical, social and educational services for their children. ICM coordinates the delivery of these services for the family once they are obtained, and helps families access seven day/24 hour assistance in crisis situations. Ask the local Mental Health Office if ICM is available in the area. EP

A PARENTS DETERMINATION and a Pre-K Dream Realized

By Sherri H. Epstein & Ann G. Bessell, Ph.D.

"It's probably Cerebral Palsy," said the Early Intervention therapist. Rachel was only four months old during this initial evaluation. She couldn't hold her head up, roll over, sit-up, or crawl. She couldn't even lift her arms or legs. She had no eye contact, cried constantly, and never slept. I knew something was wrong and feared she would never bond with me.

I remember starting to cry. The grandmothers looked on, tried to hold back their tears, but they couldn't. My perfect child was officially not perfect. After collecting my thoughts and trying to shed the feeling of devastation, I tried to think of the positives. As long as it's CP, I thought this diagnosis meant that she would be physically disabled, but her mental faculties would be intact. We called to make an appointment with a neurologist within 10 minutes of the initial CP diagnosis. Unfortunately, two months passed before we could get an appointment.

When Rachel was six months old the neurologist ordered an MRI. He informed us that, "She has 'white matter disorder' and it is probably degenerative," although he wasn't at all certain exactly what it was. Now I was wishing it was "only CP." More tests were ordered and we didn't get an affirmative diagnosis until Rachel was eight months old. We now know Rachel has Canavan Disease; a genetic disorder she inherited from both Ken and I who each carry a mutated gene that caused Rachel to be born without an enzyme in her brain to neutralize the brain fluid. Because the fluid is so acidic, the myelin in Rachel's brain is deteriorating.

The doctor was only able to give us limited information so we searched the Internet for answers, hope and guidance. We learned that children with Canavan Disease continue to deteriorate, never roll-over, walk, or speak. They lose their eyesight and become mentally retarded. Their life expectancy is from one to four years. When we made contact with other parents of children with Canavan, we learned that some children live to be ten, and a few parents buried their children at age 20. Although we found little hope, we were determined that Rachel would live as full and happy a life as we could provide.

As we did more and more research, and after talking to many parents of children with Canavan, we have learned to question what we read rather than accept the grim limitations described in the literature. We have learned to just focus on what Rachel CAN do, not on what she can't do, or what she will become. It has been even harder to convince everyone else of that, as well.

Early Intervention (EI) services started right away. I asked Rachel's physical therapist (PT) to find out how we can get a stander. Her response was "Why bother?" I couldn't believe what I heard. If anyone needed to have a positive attitude regarding Rachel, it should be her PT. I immediately requested a new PT. The new one was amazing. She met Rachel and immediately began to do wonders with her. By the time Rachel was 14 months old, the crying stopped. She was reaching for toys and standing in her stander. At that point I realized that it is up to me not to give up on her and to fight for what I believe.

It took a great deal of time convincing EI that Rachel should work with a speech therapist while at a young age. Finally, after several months, someone was assigned to work with her. Rachel lit up every time the speech therapist came. She taught Rachel to choose a song from pictures and then sing. Well, she never actually could sing, but Rachel would light up, open her mouth and sounds began to come out. To think that they didn't want to assign a speech therapist to Rachel because she wouldn't be able to talk. Another "why bother" attitude. The Speech Therapist taught me to recognize Rachel's different sounds and to let Rachel know that I recognize what she wants by these sounds. Rachel looks so proud when I let her know that I understand what she wants.

When Rachel was two I asked the EI case manager about preschool. I knew that Early Intervention was coming to an end when Rachel turned three. The case manager told me that there wasn't anything I needed to do. "It's all automatic," she said. Then she added, "EI does the paperwork and at the Individual Education Plan (IEP) team meeting.

They will go over where Rachel will go to school." I thought that sounded too simple. Nothing in Rachel's life has been simple. I said that I wanted to see the school options before the meeting so I could have some input. She told me that Rachel would be placed in a special needs class in a special needs school, so there really wasn't anything more to see.

I went over to the school to see the classroom. It was a class of seven children in their wheelchairs. Due to their severe mental and physical disabilities, the children were not able to interact with each other. It was not a very stimulating environment. Their aides were socializing with each other, instead of working with the children. I was sick to my stomach. I did not want Rachel to go here. She is fully aware of everything and very cognizant. She needs to be constantly stimulated or she will be bored.

I would take Rachel to Jessica's preschool classroom occasionally. Jessica was always proud to show off her sister. She would bring her dolls and toys to play with and want to sit with her at "circle time" to hold her hand. Jessica's friends were also very receptive. They loved having Rachel come and visit. Rachel also attended "Play Group" through Early Intervention. She loved going. The teachers would always include Rachel in every activity: circle time, sitting at the table for snack time, being put in the sensory table, and piling her lap up with toys to help clean up and bring them to the closet. She loved the attention and being able to participate. I knew that the preschool we choose should be as active.

I started to interview everyone I knew who was involved in the public school system. Friends and family members who are school teachers and therapists all gave their input. The bottom line was to insist on what I believe was right for Rachel. They told me to expect nothing, but ask for the moon. Since the people who were going to decide where Rachel should go would not have the opportunity to meet Rachel, I prepared a photo album of her. There were pictures of Rachel in playgroup, singing, playing with the other kids, and over-heating from a 90-degree day. I had pictures of Rachel in her stander "talking"

continued from page 57

with her sister, as they looked at each other eye-to-eye. There were pictures of Rachel laughing while swinging on a supportive swing in a playground. I even included a family portrait taken while we were on a ferry (to prove that we include Rachel in everything we do). Basically every picture that I included reinforced my demands of what Rachel would need.

I then started the IEP Team meeting with the following statements:

"We acknowledge that Rachel has Canavan Disease, a degenerative neurological disorder that will ultimately take her life. We feel very strongly that this is the 'prime' of her life, and therefore want her to have the most that life has to offer, as long as she enjoys it, in the least restrictive environment.

She enjoys socializing with her peers, painting, coloring, looking through magazines and pictures, doing puzzles, playing with noisy toys, computer games and listening to music. We feel she will do best in an integrated classroom with "normal, healthy" peers.

In order for Rachel to actively participate in all of the activities that an integrated classroom has to offer, she will need a one-to-one aide. Although Rachel loves to paint, due to her low muscle tone, she needs help holding the paintbrush, etc."

The team leader seemed impressed. There were about 14 people at this meeting. I brought her EI case manager, physical and speech therapists, her vision therapist, a gentleman from the Commission for the Blind, and a family advocate who has helped me get Rachel, equipment that

Dreams for Rachel to be happy

To be told that your daughter will die by age four is devastating enough. However, the lack of hope for a cure doesn't change the dreams and desires Sherri and Ken have for Rachel to be happy. Not only has school energized and enhanced Rachel's life, in return she is also making an impact on everyone she interacts with. She is teaching the children in her class about compassion, tolerance, and understanding of others. Parents should not accept the limiting self-fulfilling prophecy of others (if we treat someone as if they can't do anything, they won't).

It is evident that Rachel is doing so well because her parents don't see her limitations, and don't let others give her any limitations. They have searched for options, considered all the alternatives, and have embraced a collaborative approach so the professionals who know Rachel best can participate in the educational decisions that will provide her with the best quality of life available. Rachel will be celebrating her 4th birthday this September and continues to laugh, thrive, and embrace life.

What to Look For When Considering a Preschool

1) The Program Basics and that Teachers/Staff provide a developmentally appropriate curriculum and have the willingness to make adjustments when necessary.

A. One-on-One aide who not only meets the child's personal needs, but also makes certain that the child is included in all activities (calls for flexibility and creative thinking).

B. Program allows for modification so a special child can participate in all activities.

2) Small group size and low child-to-teacher ratio (one-on-one aide can help create a small class environment).

3) Outdoor play

A. Nature walk, playground, etc. should be wheelchair accessible (sand on a playground makes it difficult to maneuver a wheelchair)

B. Toys in gym include toys that a child in a wheelchair can play with. Shaded area so child doesn't sit in direct sunlight.

4) Health and Hygiene:

A. Nurse available every minute of the day (including bus ride in case of seizure, choking, vomiting, etc. during the ride.)

B. Changing table for diapers should be convenient and private and also allow for tube feedings, medicine administration etc.

5) Indoor Physical Environment:

A. Supportive chair that is low to the floor for "circle time"

B. Activity table that allows wheelchair to fit at the table

6) Family Involvement:

A. Maintain a notebook filled out by PT, OT, Speech, Vision therapists, as well as teacher to explain daily activity and how the child tolerated activities. This must be done daily and consistently. (If the child is non-verbal, this is especially important since the child can't tell mom how her day was. Keeping the parents in the loop, helps keep the parents involved).

B. The centers willingness to have the parents visit and observe at any time.

Ann G. Bessell, Ph.D.
Research Assistant Professor, Department of Teaching and Learning, School of Education, University of Miami, Coral Gables, Florida.

Ann got her Ph.D. after her 12-year-old son, Jonathan, lost his battle with lymphoma. Her main goal is to improve the quality of life for children with health issues. Her research emphasizes the importance of collaborative communication among professionals and teaching teachers effective educational strategies to facilitate the learning and social needs of children with special needs. She can be reached at: Agbessell@miami.edu.

she needs (Pediasure, diapers, bath chair, etc.). We were ready for a fight, but I was counseled not to go into the meeting as a fighter. We didn't want the school department to feel defensive. So I approached it as if I was an educator teaching the team all about Rachel and showing them what would be best for her. I included Early Intervention (PT. OT. Speech and vision therapists), Rachels family advocate, father and mother, school speacial needs department coordinator, princapal of school and school nurse.

I then submitted a list of concerns such as having a nurse available at all times, a one-on-one aide, a private area for diaper changes, log book to inform the parent of activities and therapy, transportation with a nurse on the bus, bottle feeding on demand, heat/cold concerns, group therapy, an integrated classroom, inclusion in all activities, proper seating and an accessible playground.

To my surprise, they took every concern seriously and worked through each issue one by one. They decided that since Rachel was prone to overheating, they would place her in a school with air conditioning. The only school that could accommodate her didn't have a classroom of three-year-olds, so she was placed in a "typical" Pre-K classroom of four-year-olds. Even though the other children stayed until 2 P.M., Rachel would go home at 11:00. As for the nurse being available, they decided that Rachel's one-on-one aide would be a licensed nurse. The school they chose also had its own physical/occupational therapy room that was filled with equipment.

I was so relieved. I loved this new school. I loved the thought of Rachel being in a classroom of healthy, typically developing four-year-olds. I knew she would do well, although I could sense the fear during the first meeting with the teacher and principal of the school. Of course they were nervous because they didn't know what to expect. The preschool teacher asked me, "What do you expect my role should be?" I simply said, "To include Rachel in everything you do with the other children. Her aide will be there to assist Rachel, but if you pass out paint brushes for a project, please give one to Rachel." She smiled and seemed relieved.

We agreed to have the nurse meet Rachel at our house on Monday and Tuesday prior to beginning school so that she could learn Rachel's cues. Then Rachel would start school on Wednesday of the same week. Well, no one showed up on Monday or Tuesday. On Wednesday I woke up, dressed Rachel, and brought her to school myself. I was determined to have her start school, even if the nurse never showed up. I was Rachel's aide for the day, and it actually worked out well. I was able to slowly wean Rachel into the school environment. I was able to answer the teacher's and

the children's questions and most importantly, I was able to see what a typical day would be for her.

The following Monday the nurse came. On Tuesday she handed in her resignation. Apparently the agency that hired her told her that it was a full time job with benefits. Actually it was three hours a day with no benefits.

When the new nurse arrived, I once again had to go to school with Rachel and teach the new nurse Rachel's cues. She has been with us ever since and Rachel likes her. Hopefully she won't quit.

Rachel's typical day begins with the mini school bus arriving to take her away. I can't help but to smile with pride every day as they whisk her off to school. When she arrives in the classroom, the children stop their activity and run over to say "good morning" and to help Rachel take her coat off. At circle time the children fight over who gets to sit next to Rachel. When the class starts to sing songs, Rachel lights up and tries to sing too. The children get so excited to see Rachel try and they all want to help Rachel move her hands to gesture the song lyrics. During activity time, children request Rachel to join their activity. They are so imaginative to include Rachel in their activity. Rachel spends the entire time laughing and smiling.

Since she started school, she has vocalized so much more and seems so be so active. She just seems so happy. She loves school. If you ask her, "What did you do today at school?" She will open her mouth and move her arms and open and close her fingers. This tells me that she sang songs and played with play dough.

I can't help but think that if I had just accepted the original suggestion of sending Rachel to a special needs classroom at that other school....well, we would never see her be so animated and happy. The EI case manager is in disbelief that the public school system has accommodated us with everything that we requested. The school department told me that they felt that since we were so passionate on not giving up on Rachel, it was their duty to do the same. They also stated that it was unfortunate that more parents don't show as much concern for educating children with severe disabilities.

I just think that maybe those parents didn't know that they could request any other options other than what was offered. When you are fighting for your child's life, it is also hard to challenge organizations that constantly say "no" to requests. It takes perseverance, dedication, and the belief that what you are doing is truly best for your child. EP

organizational spotlight

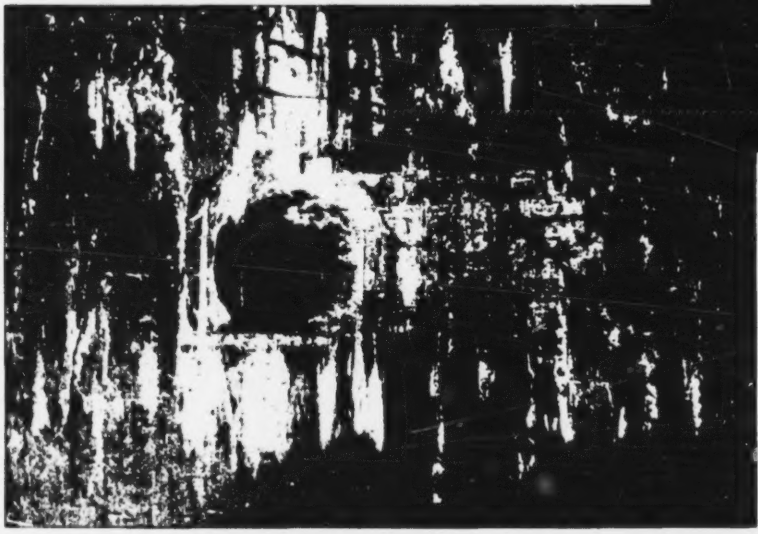
United Brachial Plexus Network, Inc.

When Kim West gave birth to her 10 pound, one ounce baby girl in 1998, she was stunned to see that her daughter had no movement in her right arm. Attending doctors told Kim her child had a brachial plexus injury commonly known as "Erb's Palsy."

The brachial plexus is a network of nerves which conducts signals from the spine to the arm and hand. These signals cause the arm and hand muscles to move. (Brachial means arm, and plexus refers to a network of nerves.) Injury to nerves of the brachial plexus can result in full to partial paralysis of one or both arms.

Stretching, tearing, or other trauma can cause injury to the nerves of the brachial plexus. Brachial plexus injuries most often occur during the birthing process (obstetrical brachial plexus injury) as a result of excessive traction or force being applied to the infant's head during delivery.

Possible symptoms of a brachial plexus injury include: a limp or paralyzed arm; lack of muscle control in the arm or hand. Other terms commonly used to describe brachial plexus injuries include: Erb's Palsy (upper trunk injury); Klumpke's Palsy (lower trunk injury); Brachial Plexus Palsy; Erb-Duchenne Palsy; Horner's Syndrome (when facial nerves are also affected); and "Burners" or "Stingers" (usually associated with sports-related brachial plexus injuries).



Connie Cannon, mother of Kierston Cannon, top left, dedicates her abstract artwork to children with brachial plexus injuries, reflecting the bonding between mothers and babies.

continued on page 62

continued from page 61

Approximately two to three of every 1,000 newborns are affected by brachial plexus birth injuries. More children suffer from brachial plexus injuries sustained at birth than Down's Syndrome or Muscular Dystrophy - yet information on this disability is not so readily obtained. Other frequent causes of brachial plexus injuries include: automobile, motorcycle or boating accidents; sports injuries; animal bites; and gunshot or puncture wounds.

West was stunned because she had been an avid reader of pregnancy and infant books during her pregnancy and had never heard of obstetrical brachial plexus injuries. Immediately, West sought the advice of a neurologist at a local children's hospital on the advice of her pediatrician, although the pediatrician felt there was nothing to be done. The neurologist also recommended a "wait and see" approach, as many obstetrical injuries do make improvements without intervention.

However, West still didn't feel comfortable with the diagnosis and went online to search out more information about brachial plexus injuries. Her search turned up the United Brachial Plexus Network, Inc. (UBPN) web site (www.ubpn.org), which included extensive descriptions of the injury, treatment options, physical and occupational therapy protocols and a message board.

The United Brachial Plexus Network (UBPN) is a registered nonprofit 501(c)3 organization devoted to providing information, support and leadership for families and those concerned with brachial plexus injuries worldwide. West discovered an avid support group online, with parents throughout the world sharing information about the injury.

"I was so relieved to have a place to go where other parents were dealing with the same frustrations I was," said West. "I just couldn't believe that my daughter had zero movement in her arm and there was absolutely nothing I could do about it."

Through the UBPN website she found the name of one of the few hospitals in the nation that specialize in obstetrical brachial plexus injuries.

Kierston Cannon, who had the surgery, rejuvenates her muscles at physical therapy.

After contacting the clinic, she found that it is essential that treatment be obtained as soon as possible from medical professionals who specialize in treating brachial plexus injuries. Early treatment for brachial plexus injuries most likely will include occupational and/or physical therapy to help maximize use of the affected arm while preventing contractures (tightening of the muscles and joints).

While each brachial plexus injury is unique, some individuals may benefit form surgery. Highly specialized and experienced surgeons utilize a variety of operative approaches in attempting to maximize an individual's function. Infants with brachial plexus birth injuries who show little or no improvement by the age of four to six months are often candidates for immediate surgery. Older children and adults may benefit from different surgical techniques as well.

UBPN, Inc. recently introduced an online medical resource. The goal of this project is to provide a comprehensive resource listing to aid families and individuals in their search for specialized brachial plexus care.

A sample of other UBPN organized programs include:

- The Outreach Program which includes the publication of a quarterly in-depth magazine with a circulation of 4,500.
- The Wings Program of UBPN which assists families or individuals in need obtain free or reduced medically-related travel.
- The Awareness Program which is dedicated to increasing awareness of brachial plexus injuries among the public at large and to reach new families and individuals affected by brachial plexus injuries and families with newborns.
- The InterACTION Program which is responsible for bringing the

members of the brachial plexus community together for positive interaction and sharing of information and support. The InterACTION program facilitates Camp UBPN, which is held every other year. The next camp is planned for September, 2003 in Silver Bay, NY.

After finding the UBPN web site, West contacted the group to see how she could help reach other parents trying to find more information about brachial plexus injuries. Since her initial contact, she has become involved with Awareness activities and is currently serving as secretary for the UBPN organization.

West's daughter is now four and has had two surgeries to her arm, including nerve grafts to her brachial plexus and muscle releases to increase function. Her daughter has weekly physical and occupational therapy visits, along with daily range of motion and "play" therapy at home.

"Although our improvements have come slow, it is amazing to see my daughter clap with both hands when she had no movement at seven months of age," West said. "I give total credit to the United Brachial Plexus Network and the resources they have available online. Without them, I would have never found brachial plexus experts to help me navigate through the issues of this injury."

It is important to note that even with ongoing therapy treatment and surgical intervention, complete recovery from a brachial plexus injury may not occur. Maximizing functional use of the injured arm in generally the overall goal of affected individuals, families and medical professionals. UBPN is here to help families reach their goal. **EP**

Camphill Special School
Children's Village
A not-for-profit residential school community where children with developmental disabilities are truly celebrated.

Is your child receiving a caring and compassionate education?

Since 1960, the families at Camphill Special School have invited children with special needs into their homes and into their hearts; living together as extended families they share the daily rituals of meals and chores, as well as the challenges of school and therapy.

Each House Parent has received specialized training and is prepared to nurture your child's capabilities and guide them toward a brighter future.

Health Institution of the Month

THE VALLEY HOSPITAL

For more than 50 years, since its doors opened in August 1951, The Valley Hospital has been at the forefront of providing quality and state-of-the-art healthcare. This includes providing innovative, high-caliber, specialized services to children with special needs and their families.

The Valley Hospital
Valley Health System
Respected Medicine, Respectful Care

ABOUT THE VALLEY HOSPITAL

The Valley Hospital is a fully accredited, acute care, not-for-profit community hospital serving more than 300,000 people in Bergen County, New Jersey and adjoining communities. Its current licensed capacity is 451 beds. Audrey Meyers serves as hospital president and chief executive officer. In 2001, 44,000 individuals were admitted to Valley and 52,600 people were treated in our Emergency Department, making Valley the second busiest hospital in the state of New Jersey. Also in 2001, Valley provided charity care services amounting to $5,894,451.

The hospital is known for its state of New Jersey-designated Neonatal Intensive Care Unit directed by three full-time neonatologists and its Maternal Fetal Medicine Program, overseen by physicians affiliated with New York University School of Medicine. Valley is also the leader in the field of cardiology services.

Recent innovations to the hospital include the opening of The Center for In Vitro Fertilization and Reproductive Endocrinology, in affiliation with New York University School of Medicine. Also, the opening of The Center for Childbirth, offering comprehensive obstetrical, prenatal and neonatal care; the establishment of a state-of-the-art Critical Care Service and a newly renovated Pediatric Unit.

LEADING THE WAY IN SCREENING

Every year, more than 3,000 babies are born at Valley's Center for Childbirth and each is screened for more than 50 metabolic disorders. Rather than wait for a state mandate (New Jersey currently requires that hospitals screen for only 14 disorders), Valley has adopted universal newborn screening and is the first hospital in northern New Jersey to do so. Its universal screening program is conducted with Neo Gen Screening, in a private laboratory.

Newborn screening is performed in the first days of life before the baby leaves the hospital. It offers a simple, inexpensive way of determining whether a baby has a metabolic disorder that if left untreated, could lead to permanent brain damage, even death. Metabolic disorders, which affect about one in 1,000 babies born in the US each year, are inherited genetic disorders that obstruct the body's ability to break down fats, sugars or proteins in food. Most babies born with these disorders look and act perfectly healthy at first. Without newborn screening, the problem is not discovered until the child develops symptoms, which is often too late to prevent permanent damage.

"Metabolic disorders are not common, but when they do occur they are usually serious and may be fatal," says Frank P. Manginello, M.D. and Director of Neonatology at Valley and an active proponent of universal screening. He is also the medical director of Valley's Center for Child Development, a diagnostic and therapeutic facility for children with developmental problems.

"Our screening program allows us to identify these disorders soon after birth and often start treatment before babies suffer brain damage or other permanent harm." Dr. Manginello has lectured on this topic at two national meetings and was the moderator of "Children at Risk-The State of Newborn Screening" presented by EP and the EP Foundation for Education, Inc.

Valley is also a leader in providing universal hearing screening for newborns. "Recognizing the importance of early detection, The Valley Hospital implemented universal newborn hearing screen-

Audrey Meyers, President and CFO, Valley Hospital

ings long before it was state mandated," says Valley Audiologist Elizabeth Lanza, M.S., CCC-A. Studies show that early diagnosis and intervention can minimize developmental delays that arise from hearing impairment and that infants who receive intervention before six months of age maintain language development commensurate with their cognitive abilities. "Therefore," says Ms. Lanza, "early screening, follow-up and treatment are critical."

SPECIAL CARE RIGHT FROM THE START

More than 250 newborns are admitted to Valley's 15-bed Neonatal Care Unit (NICU) each year. Babies in the NICU are usually the tiniest of newborns, often born prematurely with low birth weight. About half of the admissions are unexpected.

The NICU's three board-certified neonatologists are backed by a support staff of respiratory therapists, physical therapists, pediatric pharmacists, social workers and nurses. 99.9 percent of the babies have successful outcomes and the complication rate is very low, even for the smallest babies.

Associate Director of Neonatology, Carly Pané, M.D. and Dr. Manginello, author of the book, *Your Premature Baby*, have both appeared in New York magazine's prestigious annual Best Doctors list. The NICU medical staff also includes Neonatologist Beth Benjamin, M.D.

The state-of-the-art NICU was designed with every precaution for seriously ill infants and for increased monitoring capabilities, as well as visibility from the nurses' station. Walls were treated with insulation to reduce noise levels. There is softer lighting that studies show has a positive impact on NICU babies.

Dr. Pané points out that the NICU team is committed to providing individualized, family-friendly care. "We have always believed strongly in getting parents involved from the beginning and giving families as much support as possible," she says. "The average length of stay for NICU babies is two weeks, but some are with us for two months. That's a long time for parents to be separated from a newborn - time in which they may begin to feel a loss of control, instead of being directly involved with the baby's progress."

Dr. Manginello adds that additional spacing surrounding each bassinet affords privacy for visiting parents. He is a strong believer in the benefits of "kangaroo care" for sick infants, noting that studies have shown that babies thrive better with skin-to-skin contact. Privacy in the NICU allows a mother to sit with the newborn, creating a 'pouch' on her chest in which the tiny baby can snuggle.

"Our unit allows us to provide highly technological but friendly, family-focused care," Dr. Manginello says. "And with staff coordination, there's a continuous liaison between the NICU and the Center for Child Development."

HELPING SPECIAL NEEDS CHILDREN REACH THEIR POTENTIAL

Imagine a youngster who never gets to ride a bicycle because of developmental delays that make it impossible for him or her to operate one. Now imagine the same child helmeted and atop a specially equipped bicycle that, with help from a therapist, can be controlled with hands. Anyone who observes the happy faces of parents and children at the Center for Child Development will recognize this as a rare and wonderful kind of therapy.

Valley's commitment to the continuum of care for children with special needs and their families is most evident at The Center for Child Development, a diagnostic and therapeutic facility for children ages newborn to 16 that was an outgrowth of the NICU. The Center's services include:

- speech, physical and occupational therapies;
- evaluations and treatment for sleep problems;
- audiology services;
- counseling and social services;
- pulmonary care;
- nutrition counseling;
- parent support groups;
- educational assessments;
- high-risk newborn follow-up.

All these services give children and their parents the comprehensive care that is needed to deal with a variety of medical behavioral or developmental concerns.

The Center opened its doors in 1991 after Dr. Maginello recommended that Valley establish a program to assist children with special needs discharged from the NICU. "Initially, we founded the Center to serve as a resource for special-needs or at-risk babies identified in the NICU," Dr. Manginello explains. "The Center has grown to accommodate the needs of children in the community and today NICU patients make up the minority of children who receive services at the Center."

Children can present at any age, from infancy through school age, with developmental, behavioral and learning issues. When parents or professionals have concerns about a child's development, the Center can provide comprehensive neurodevelopmental and psychoeducational evaluations. Lisa Nalven, M.D. and Director of Developmental/Behavioral Pediatrics and school psychologist Lois Hochberg, M.A., Ed.M., collaborate to recommend interventions that support each child's optimum development. **EP**

PHARMACOLOGICAL Treatment Options FOR AUTISM, PART 1

By C.T. Gordon, III, MD

Psychopharmacologic research over the past several decades has given us a safe and effective supply of medications which can be applied to the treatment of autism. Many stem from the treatment of such conditions as attention deficit hyperactivity disorder (ADHD), anxiety disorders, depressive and bipolar disorders and psychotic disorders.

These medications effectively treat a number of symptoms and behaviors frequently present in individuals with autism. These include hyperactivity, impulsivity, attentional difficulties, anxiety, obsessive-compulsive symptomatology, repetitive motor behaviors (for example, tics and stereotypies), depression, mood swings, agitation, aggression, self-injurious behavior and insomnia.

Most of these clinical characteristics are considered "associated behaviors" in autism. Impairments in certain aspects of attention (for example, joint attention) and repetitive, ritualized behaviors are examples of core autistic symptomatology, which can be positively affected by medication.

The ultimate goal of medication in an individual who has autism is to prepare the brain's physiology to take optimal advantage of other aspects of treatment. These efforts include behavioral, educational and other experiential learning that can directly address core autistic cognitive impairments such as receptive, expressive, and pragmatic language abilities, social deficits and self-directed, repetitive behavior. In other words, pharmacologic intervention should typically be viewed as only one part of a multi-modal treatment plan for an individual with autism.

Overview of Medications

In this two-part series, we will focus on four major groups of medications: neuroleptics, anti-depressant/anti-anxiety agents, stimulants and anticonvulsants. It will become readily apparent that many of these medications affect more than one symptom or behavior. That is, they are relatively nonspecific in terms of their benefits. For each of these commonly prescribed groups of medications, general indications and side effects will be discussed.

As the medical community gains a better understanding of the genetics and biochemistry of autism, it will be possible to develop pharmacologic therapies which directly address underlying abnormalities; ie, more specific treatments.

However, the potential benefits of these nonspecific medications should not be underestimated. In some individuals they can result in a significant increase in the rate of learning or reduce aggressive behavior for an individual with autism so that institutionalization can be avoided.

It must be recognized that different people may respond to the same medication quite differently and an individual's response at different stages of brain development may vary depending upon age, associated medical conditions and other factors. For example, a medication which produces a behavioral side effect preventing its use for a child at age seven may not produce this side effect and be quite useful at age ten.

The brain is continually developing, especially during the first 21 years of life, and this needs to be taken into account. Because of individual differences in brain chemistry as well as differences in the rate of metabolism (breakdown) of medications, markedly different doses may be required for different individuals.

No Guessing

Even though the situation is quite complex, the prescription of medication for autism is not purely a "shot in the dark." Patients are not guinea pigs, and a physician should not simply prescribe whatever first comes to mind as an experiment.

Optimizing the benefits of the available medications requires the physician to bring to bear both art and science. Accurate conceptualization of symptoms and behaviors into groups of treatment-relevant target symptoms is necessary for medications to be effective.

There have been multiple scientifically sound, double-blind, controlled studies of all these medications. Most have been done on adults with other conditions; however, there is a sound base of information on psychopharmacologic agents from studies in children and a growing body of scientific data on medications in children and adolescents with autism. The prescribing physician needs to be aware of these studies and experienced in the pharmacologic treatment of patients with severe neurodevelopmental disorders, including autism.

Optimizing the benefits of the available medications requires the physician to bring to bear both art and science. Accurate conceptualization of symptoms and behaviors into groups of treatment-relevant target symptoms is necessary for medications to be effective. These interpretations and judgments are based on history from parents, teachers and other therapists, as well as direct observation of the individual with autism.

Clear target symptoms need to be established, information about transient and long-lasting possible side effects should be outlined, dosing should start low and escalate carefully, and a trial needs to be conducted for an adequate length of time.

Furthermore, medications need to be prescribed systematically. There is no room for "magic concoctions." Medications need to be prescribed one at a time so that effectiveness and side effects can be accurately determined. There are certainly times when a patient benefits from a combination of medications, but excessive polypharmacy should be avoided.

Neuroleptics

Neuroleptics, also called anti-psychotic medications, have been the most widely studied class of psychopharmacologic agents in autism over the past 35 years. The drugs were originally developed for the treatment of schizophrenia, a psychotic illness with prominent delusions, hallucinations and disorganized, illogical thinking.

Until the mid 1970s, autism was hypothesized to be a very early onset form of schizophrenia; this formed

continued on page 68

continued from page 67

part of the rationale for using these agents in autism. Neuroleptics are effective in treating severe anxiety, agitation and aggression in several non-schizophrenic populations and there was hope they would provide similar benefits to individuals with autism. In addition, neuroleptics are strong blockers of the neurotransmitter dopamine. (During the 1960s and early 1970s, a "dopamine theory" was used to explain autism, suggesting that excessive dopamine was responsible for much autistic symptomatology.)

Since the 1960s, there have been multiple controlled studies of neuroleptics in children and adolescents with autism, with the majority involving drugs like haloperidol (Haldol) and lesser numbers with thioridazine (Mellaril) and trifluoperizine (Stelazine). These neuroleptic agents were found to decrease hyperactivity, stereotypic behavior (self-stimulatory, simple and complex movements), withdrawal, aggression and temper outbursts, and facilitate learning in children with autism.

Since the 1960s, there have been multiple controlled studies of neuroleptics in children and adolescents with autism, with the majority involving drugs like haloperidol (Haldol) and lesser numbers with thioridazine (Mellaril) and trifluoperizine (Stelazine).

The problem with these neuroleptics is their side-effect profile, which includes sedation as well as acute and chronic neurologic side effects. Acute neurologic effects (extrapyramidal effects or those involving descending nerve tracts other than the pyramidal tracts) include tremors, slowing down of movements and stiffening of the muscles (a Parkinson-like syndrome). More chronic neurologic side effects include withdrawal or tardive dyskinesias. Dyskinesia is a syndrome that causes potentially irreversible, involuntary dyskinetic movements, which may develop in patients who have been treated with anti-psychotic medications. Withdrawal dyskinesia involves abnormal movements that occur for several weeks to months when the dosage of the neuroleptic is lowered too rapidly. Tardive dyskinesia is a similar involuntary movement disorder which may occur, usually, after years of neuroleptic treatment. However, it can sometimes occur with shorter courses of treatment. In some cases, even if the neuroleptic is discontinued, the tardive dyskinesia can continue and become permanent.

Haldol and the Newer Narcoleptics

Despite their adverse effects, Haldol and similar neuroleptics remained the major medications used in autism until the 1990s. Over the past eight years or so, a new generation of neuroleptics has been introduced on the market with equal or better effectiveness for schizophrenia and far fewer side effects. This new group of neuroleptics shares some similar chemical effects with the older neuroleptic group, but there are also important differences. In general, the new generation of neuroleptics has less success in blocking dopamine type II brain receptors but more in blocking dopamine type I receptors, and much more blockade of several different types of serotonin receptors. These drugs have been called "atypical neuroleptics" because of their similar clinical effects but differing neurochemical profile. Presently the four that have been approved by the FDA and widely available are

Atypical neuroleptics generally are equal to or better than the old group of neuroleptics in terms of effectiveness and superior in terms of side effects. Usually, in clinical practice, one or more atypical agents are first tried before the older neuroleptics are considered.

risperidone (Risperdal), olanzapine (Zyprexa), clozapine (Clozaril), and quetiapine (Seroquel).

Risperidone

Risperidone is the only one of the four atypical neuroleptics that has been investigated in a controlled study of autism. Researchers found risperidone to effectively treat motor stereotypes, hyperactivity, impulsivity, agitation and aggression in a double-blind placebo controlled study. Recently, the New England Journal of Medicine published a controlled study of risperidone in children with autism that reported the drug was useful in controlling aggression and self-injurious behavior in children with autism and related disorders. This large-scale study was funded by the National Institute of Mental Health (NIMH), which is currently sponsoring several childhood psychopharmacologic studies as part of its research units for pediatric psychopharmacology (RUPPs).

Numerous open-label trials and case studies of risperidone in autism have had similar results. Thus far, the side effects profile of risperidone in individuals with autism has been favorable. Neurologic side effects are shown to be drastically reduced, although acute extrapyramidal symptoms still occur. The potential for tardive dyskinesia is as yet unclear, since risperidone has not been on the market long enough for it to be fully assessed. The most common side effects of risperidone have been increased appetite and, less often, sedation.

Olanzapine

Olanzapine is probably the second most prescribed atypical neuroleptic (after risperidone) for autism, although, to date, there are no published controlled studies involving individuals with autism. In my experience, benefits and side effects are similar to those seen with risperidone overall. However, an individual patient often responds much better to one versus the other, and there is no way to predict which of the two may be more beneficial.

Clozapine

Clozapine is more rarely used because it has a possible life-threatening side effect of lowering the white blood cell count, so that regular blood testing is required as long as the patient continues to take the medication. However, in my experience, clozapine has been an extremely effective medication for severe aggression and agitation in very affected, treatment-resistant adolescents with autism spectrum disorders (ASD). It has worked when nothing else has.

Quetiapine

Quetiapine is the atypical neuroleptic that has most recently appeared on the US market. There is little published data regarding quetiapine for autism, but my clinical experience is that it may be a useful alternative, especially when patients have prohibitive side effects with the other atypical neuroleptics. Thus, even though its role in autism

Get More Out of Vestibular Stimulation with The Motion Table

The Motion Table enables therapists to deliver the value of vestibular motion to their patients without the need for constant hands-on intervention.

Most stimulation equipment available today reduces the therapeutic effect of *horizontal motion* by incorporating rounding, swinging and tilting motions. **The Motion Table**, through its smooth, "vibra glide" movement provides a steady, uniform stimulation that can help "level out" extremes in patients' behavior.

And, since **The Motion Table** is motorized, patients can be stimulated for longer periods than is possible with manual equipment.

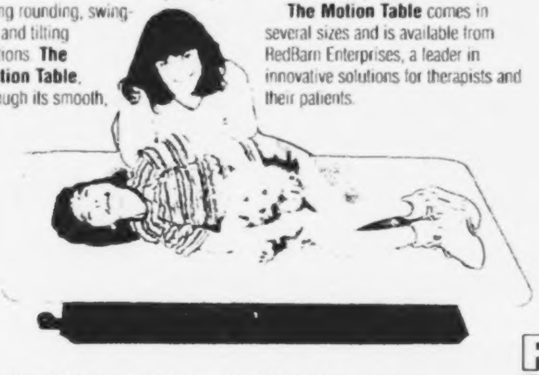
The Motion Table comes in several sizes and is available from RedBarn Enterprises, a leader in innovative solutions for therapists and their patients.

The Motion Table reduces...

- *Hypersensitivity*
- *Self-abuse*
- *Abnormal Muscle Tone*
- *Constipation*
- *Pulmonary Congestion*

The Motion Table increases...

- *Concentration*
- *Attentiveness*
- *Calmness*
- *Body Awareness*
- *Postural Control and Balance*



RedBarn

continued from page 69

is yet to be established, it is showing some initial promise.

To summarize, neuroleptics are very useful for a group of children with autism who have prominent hyperactivity, impulsivity, agitation, temper outbursts or aggression towards self or others. Often, once these behaviors are reduced, these individuals can make better use of behavioral and educational interventions. Atypical neuroleptics generally are equal to or better than the old group of neuroleptics in terms of effectiveness and superior in terms of side effects. Usually, in clinical practice, one or more atypical agents are first tried before the older neuroleptics are considered. However, to date there has not been a study directly comparing atypical to typical neuroleptics in autism.

Next month: Using Anti-Depressants and Anti-Anxiety Agents, Stimulants & Other ADHD Medications and Anticonvulsants in the treatment of autism spectrum disorders. EP

Editor's Note: Readers should remember, as Dr. Gordon state's in this article, that pharmacological treatments are not cures for autism spectrum disorders, but assist in helping to manage some symptoms of autism and related disorders that are similar to symptoms associated with other neurological disorders. To determine whether your child may benefit from pharmacological interventions to treat autism, talk your child's pediatrician and/or child psychiatrist.

C.T. Gordon, III, MD, is a child psychiatrist in private practice in Bethesda, MD and a trustee of the National Alliance for Autism Research (NAAR). He is also the father of a child with autism and currently serves on NAAR's Medical Affairs Committee.

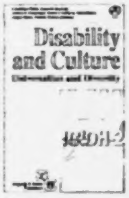
For Adults...

We're the People, Too: Tales from America's Largest Minority
BY WALT DUDLEY ITRICH
☆☆☆☆
EP Library Code: CP0266GN
EP Library Price: $16.95

Since 1994 Itrich has been in contact with the people whose stories are told in this book. This book takes "Chicken Soup for the Soul," and combines it with facts and other information to not only inspire those with a disability, but also help them learn about the problems they may encounter. From spinal chord injuries to ADA to AIDS, there's a story in this book that can educate and affirm everyone.

My Journey with Jake
BY MIRIAM EDELSON
☆☆☆☆
EP Library Code: BTL7350GN
EP Library Price: $ 14.95

Miriam Edelson's story has spread across the continent because of the love and devotion she displays, and this book is no different. The book follows her son through birth, diagnosis and each illness and decision that accompanied his every day. Through the story of her son's life readers are reminded what pediatric health care should be from one of their best advocates, the parent.



Disability and Culture: Universalism and Diversity
BY USTUN, CHATTERJI, BICKENBACH ET AL.
☆☆☆
EP Library Code: HHP239XGN
EP Library Price: $44.50

This professional resource presents the findings of the ICIDH-2 cross-cultural Applicability Research study conducted between the World Health Organization, the US National Institutes of Health and multiple centers worldwide. The results presented discuss cultural factors that contribute to disabilities, access to healthcare and social stigmas that surround those with disabilities in countries that include but are not limited to Canada, India, Cambodia, Luxembourg, Japan, Nigeria, Spain and many others.

Asperger Syndrome Employment Workbook
BY ROGER N. MEYER
☆☆☆
EP Library Code: TF7960AS
EP Library Price: $29.95

This resource can be used by any individual with a disability, not just those with Asperger syndrome. Sections I and II provide detailed yet simple instructions and examples that will help the reader complete Section III. This final section consists of pages of questions that can help a person expand their self-knowledge and learn more about what job would suit them through carefully planned exercises and an intense look at their previous work experience.

For Kids...

Paul and Sebastian
BY RENE ESCUDIE & ULISES WENSELL
☆☆☆
EP Library Code: KP1499YLP
EP Library Price: $6.95

Paul lives in a green trailer with blue curtains and Sebastian lives in a blue apartment with green curtains. Though their mothers think they're too different to play together, the boys learn otherwise, and eventually teach their mothers this same lesson. Differences become negligible in this story of two boys, teaching children that having different lifestyles shouldn't prevent people from being friends.

The Giantess
BY EVELINE HASLER & RENATE SEELIG
☆☆☆
EP Library Code: KP1766YP
EP Library Price: $12.95

Emmeline has always lived in seclusion at the end of the forest because she's taller than the village folk. When a neighbor convinces her to attend a carnival where she can pass her secret off as a costume, she learns that there's more to being a good person than height. The children of the village offer her acceptance and friendship while teaching her that she can help them do wonderful things simply because she's different.

This Holiday Season's Best Buy: OPTIMISM

Raising a child with challenging behaviors is stressful for parents. Research suggests that an optimistic outlook on life buffers this stress.

How does one acquire "optimism?" When I was a little girl, my grandfather used to say: "Half the things you worry about never happen." My response always was, "But what about the other half?" Was he the optimist and I the pessimist? It's not that simple. He viewed life without worry to be the same as optimism. I viewed realistic appraisal of things that can't be helped or changed as calming. At the very least, one can feel "pleasantly surprised" if those things you worry about don't happen!

> **Half the things you worry about never happen!**

Researchers have begun to study the personality trait of Optimism-Pessimism, and, no surprise, optimism is better for you. Optimists have a favorable outlook on life; they believe that good rather than bad things will happen to them. Furthermore, they are more likely than pessimists to face adversity and stress with continued effort. Edward Chang, at the University of Michigan, and his associates have researched optimism and pessimism in adults. Among other things, they found that optimism is associated with, and leads to, securing positive outcomes, whereas pessimism is associated with, and leads to, negative outcomes.

Researchers can conceptualize optimism

Researchers distinguish between two kinds of optimism: optimistic explanatory style and dispositional optimism. People who have an optimistic explanatory style have developed a method of explaining away bad events, perhaps seeing them as only temporary ("She will certainly outgrow this") or very specific to one situation rather than as applicable to their entire lives ("He only throws temper tantrums at home – no where else, so it's not really a problem.") Optimists may believe that failures aren't their own (or their child's) fault, but rather, due to the circumstances ("She never would have done that if the teacher were more sympathetic.")

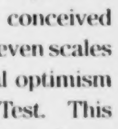
Dispositional optimism represents generalized positive expectancies about future outcomes, broadly conceived ("Everything will turn out just fine.") There are even scales that researchers can use to assess dispositional optimism and pessimism, such as the Life Orientation Test. This measure contains items such as: "In uncertain times, I usually expect the best," or, "If something can go wrong for me, it will."

An optimistic outlook makes a difference?

There is considerable evidence that optimism is beneficial to one's physical and mental health. Studies reveal, for example, that optimists have fewer illnesses and doctor visits, fewer accidents, better physician ratings of their general well being, and longer survival times following a heart attack or disease. Optimists even have longer lives!

Researchers have attempted to identify how optimism actually leads to healthier outcomes. One theory is that a positive attitude produces less stress on one's immune

Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, where she has been a researcher for 20 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of mental retardation, dual diagnosis and the transition to adulthood. Dr. Blacher has developed **Research Reflections** as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to **Research Reflections** and any suggestions you might have. Send e-mail to: jan.blacher@ucr.edu.



system. Another theory focuses on the more rewarding social relationships enjoyed by optimistic people. Still another theory begins with the different thinking (cognitions) of optimistic and pessimistic people. While pessimists focus on negative aspects of a situation, optimists are more likely to see positive as well as negative aspects. Moreover, optimists are more likely than pessimists to interpret negative events in a positive way and to find meaning and growth in stressful experiences.

Aaron Beck and his colleagues have found that chronic engagement in pessimistic thinking can result in ready access to negative schemas, instinctive ways to scan one's world and to select out negative aspects. Negative thinking leads to negative emotions, such as anxiety or depression.

Other constructs, similar to optimism, also show positive relationships to parental well being.

Imagine two parents, one optimistic and one pessimistic, accompanying their child with a disability to a new school on the first day. The pessimist sees his child playing alone, interprets this as rejection by the other children, and comes away remembering that his child has social problems. He's feeling down. The optimist sees her child playing alone also, but she also perceives the neat playground equipment and the welcoming teacher. She comes away remembering all of this, and also interprets her child's solitary play as initial hesitation in a new situation that will be soon overcome. She's feeling happy.

Stress and Optimism

Stress is a fact of life in most families with children, and there is overwhelming research evidence that families who have children with disabilities experience more than their fair share. Heightened parenting stress has been documented across ages, stages, and different specific disabilities and genetic syndromes. However, that's not the whole story. To counter-balance this more pessimistic view of family impact, recent studies also have demonstrated the positive impact of a child with disability on the family.

During most of the 20th century any parent who expressed positive views of having a child with a disability might have been viewed as in denial, or as rationalizing a bad situation. However, Ann Turnbull and her colleagues at the University of Kansas Beach Center on Families and Disability, recognized the fallacy in this, and focused their theory and research on the positive benefits from having a family member with a disability (spelled out in the book, Cognitive coping, families, and disability, 1993). They viewed cognitive coping strategies, such as those used by our optimistic mother in the example above, as a positive adaptation to stress. For example, some parents reported that just having a child with disabilities strengthened their own adaptive capacity.

Optimism helps meet parenting challenges

There is some evidence, albeit not entirely consistent, that mothers high in optimism experience less negative impact on their own well-being from their children's challenging behavior. Bruce Baker at UCLA, Malin Broberg Olsson (a Fulbright Student Scholar visiting from the University of Trollhattan-Uddevalla, Sweden) and I have been studying whether the individual personality trait of dispositional optimism can serve as a "buffer" between child behavior problems and parent well being. We are finding that when child behavior problems are low, optimistic and pessimistic parents report similar scores on measures of well-being. Parental well-being worsens as child behavior problems increase, however, and then we see the benefits of an optimistic outlook. When child behavior problems are high, optimistic mothers show the least decrease in well-being, while pessimistic mothers show a much greater worsening of stress, depression, and marital adjustment.

Other constructs, similar to optimism, also show positive relationships to parental well being. Richard P. Hastings and Tony Brown of the University of Southampton, England, examined "self-efficacy" and how it relates to well being in parents of children with autism. In this study, self-efficacy referred to parents' perceptions of their own skills in dealing with children who had behavior problems. As with optimism, self-efficacy moderated depression; when child behavior problems were high, parents who perceived greater effectiveness in dealing with their child's problems reported less depression and anxiety.

Optimism is free

We are reminded of the cartoon of a man holding a placard at a stoplight that reads: "Please help! I'm a pessimist hav-

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in EXCEPTIONAL PARENT.

How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly.

Be sure to tell them you saw their ad in EXCEPTIONAL PARENT!

continued from page 73

ing a good day." Most interventions, though, would be more likely to target individuals who have a bad day, most of the time. Although it is believed that optimistic or pessimistic thinking crystallizes around age nine and remains stable across one's lifespan, it can, in fact, be changed.

The Penn Optimism Program (at the University of Pennsylvania) selects school-aged children who are at risk for depression. They meet in groups of 8 to 12 children, with a leader, for 12 weekly sessions. The curriculum begins with a focus on recognizing pessimistic thinking and then moves on to teaching more optimistic thinking and behaviors that help counteract pessimism (e.g. relaxation, problem solving). Does it work? In a two-year evaluation, participants had half the rate of moderate to severe levels of depressive symptoms than did comparable children who did not participate. Parents can develop a more optimistic outlook as well. For example, the most successful psychological treatment for depression is cognitive behavior therapy, a major component of which is helping people to identify negative thought patterns and to develop alternative ways to view life events.

Heightened parenting stress has been documented across ages, stages, and different specific disabilities and genetic syndromes.

So be sure to put "optimism" on your Holiday gift list. The price is right. Like other "best things in life," an optimistic outlook is free.

A list of studies on which this particular column is based may be obtained by e-mailing requests to: epedit@aol.com. Special thanks to Bruce L. Baker and Malin Broberg Olsson for contributing their ideas about optimism. **EP**

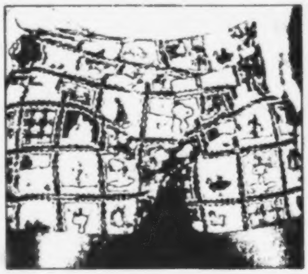
Festive Holiday

PROTECTIVE UNDERGARMENTS

By Lori Ostrover



Children with disabilities need security when wearing undergarments, and they do not want to feel like they have a diaper on. They want to be able to wear what all the other kids are wearing.

Most parents want convenience when a child needs changing. Drymids® Protective Undergarments make products for children with special needs up to the age of 21 and range to fit sizes from 30 to 200+ lbs. The company has recently come out with a new, patented composite fabric that is used on the sides and portions of the front and back of the garments. What makes this fabric so unique is the stretch and recovery. It is also very comfortable and discrete.

The durable fabric is made with Polyester and Lycra. It is more versatile than a knit and has more strength over a non-woven. During the production process the step that makes this fabric greater than others, is the heat that is applied after the fabric goes through the stitch-bonding machine. This heat process brings the stitching closer together and the fabric fills in more. It makes the fabric extra soft, prevents shrinking and reinforces stretch.

Every Protective Undergarment has a built in support system that contains a Pocket-Sling™ manufactured by Tailored Technologies. These hold either a disposable or reusable pad.

Drymids® is dedicated to the special needs market. They will listen to all feedback from their customers and will adjust products based on individual needs the best they can.

They have four main products:

- a basic pull-up • boxer shorts
- double front (frontal flap for the wheelchair bound)
- the "belted" undergarment (one size fits all).

The company is busy making garments with new prints in time for Christmas. There are attractive patterns with Christmas trees, snowmen, stockings and snowflakes. For more pictures and information, visit the web site http://www.drymids.com or call 1-866-DRYMIDS. EP

Risk Genes for ADHD

Researchers from the Center for Neurobehavioral Genetics and other departments at UCLA and the Wellcome Trust Centre for Human Genetics, Oxford, UK have localized a region on chromosome 16 that is likely to contain a risk gene for ADHD.

A report on their research, published in the October, 2002 issue of the American Journal of Human Genetics, suggests that the suspected gene may contribute as much as 30 percent of the underlying genetic cause of ADHD. Other research has suggested that as much as 70 to 80 percent of the cause of the disorder is genetic.

Because this single risk gene may account for some 20 to 25 percent of the overall causes of ADHD, identifying it will help researchers and clinicians to better understand the biology of the condition and probably lead to improved diagnosis, early intervention and treatment.

The human genome has about 35,000 genes, and the research has narrowed the focus to 100 to 150 genes. The gene may also be involved in causing autism. However, Susan Smalley, PhD, principal investigator on the study and co-director of the Center for Behavioral Genetics, cautions that much more research is necessary. While other studies have suggested that the gene causing autism also resides on chromosome 16, it is far too early to determine a distinct risk gene for each disorder or whether certain genes are involved in both disorders. It may be that the risk gene for ADHD and the one for autism just happen to be in close proximity on chromosome 16.

Rise in Autism Attracting Attention

In an attempt to explain the extreme increase in childhood autism in California in the past decade, a study from the M.I.N.D. Institute at the University of California-Davis has discounted changing diagnostic criteria and other statistical incongruities as possible explanations.

As the number of children with autism has increased to what some are calling epidemic levels, parents and researchers have been searching everywhere for some kind of explanation. While everyone seems to have a personal theory on what may trigger autism—genes, childhood vaccinations, environmental factors, birth injuries—no single cause of the condition has been identified.

There are no national statistics on autism, since criteria for diagnoses and systems of reporting incidences vary from state to state. The Centers for Disease Control and Prevention is working in 13 states to look at the apparent increase in autism. It is unclear whether the M.I.N.D. Institute findings apply to the rest of the US.

In California, the number of children with profound autism rose from 2,778 in 1987 to 10,360 in 1998—more than tripling in a decade—and has continued to increase since. According to the California Department of Developmental Services, who reported those statistics in 1999, the number of cases as of July 2002 was 18,460. The 1999 report prompted the California Legislature to commission a further study at UC-Davis. This most recent study ruled out demographics, changes in the way autism is diagnosed and increased migration of children with autism into California as possible explanations for the increase.

In order to examine these possible explanations, researchers conducted a study of 684 children taken from two different age groups: about half of them were ages 17 to 19 years old (born 1983-1985), while the other half were ten years younger (born 1993-1995). Within the overall group, 375 had been diagnosed with full syndrome autism, while 309 had mental retardation and developmental delays (MR/DD) but did not exhibit full syndrome autism.

The study would have revealed any changes in diagnos-

We now have a new monthly in depth look at reports and studies on issues that affect the special needs community. Each issue will feature information on the latest medical and scientific updates that apply to our readers.

tic standards during the ten-year gap, and shed light on whether or not loosening diagnostic criteria were responsible for the increase. The study showed, however, that standards were the same in both age groups. Questions of migration—families moving into the state that had children with autism—were dispelled as well. Fully 87 percent of the older group and 93 percent of the younger children groups studied were born in California. A general increase in population could account for about 10 percent of the overall increase in the rise.

The M.I.N.D. research addressed issues of misdiagnoses, because it had been found that some children diagnosed with MR/DD without full syndrome autism did indeed meet DSM-IV criteria for autism. The study showed that the rate of misdiagnoses was consistent between the two groups.

Half of the parents of children in each age group studied said that they do not know what caused their child's autism. A third of them cited genetics as a cause. Others blamed immunizations, birth injury or environmental factors. Birth injury or environmental factors were cited by roughly the same percentage of parents in each age group. It is interesting to note that while parents of 18 percent of the older cohort reported immunization as a contributing factor, 33 percent of the younger group believed that immunization had played a part.

> Some childhood vaccines have contained mercury-based preservatives that some blame for brain damage in children, but so far no conclusive evidence exists to pinpoint any vaccine as a culprit

Infant immunizations are often blamed for causing autism, especially the measles-mumps-rubella (MMR) vaccine (see EP, February 2002). It is true that, until recently, some childhood vaccines have contained mercury-based preservatives that some blame for brain damage in children, but so far no conclusive evidence exists to pinpoint any vaccine as a culprit.

We know that genetics plays a role in autism, but genetics alone cannot account for such a sudden rise in such a short period. It may be that some other factor can trigger autism in someone whose genetic makeup is already susceptible. In any case, we know that there is no single cause of autism. The rest is still a mystery. AAMR

Oral Sensitivity, Dental Health, and Prevention

Lee Barks, RN, MN, ARNP, FAAMR and
Debbie Lord, MA, CCC, SLP/L, FAAMR

AAMR promotes progressive policies, sound research, effective practices, and universal human rights for people with intellectual disabilities.

Oral Health-An important part of any regimen

To a person with disabilities, oral healthcare may cause pain rather than a sense of well being. Instead of the normal sensation of tooth brushing, these stimuli may feel like burning, cold, searing pain, or some other sensation. The person naturally defends him- or herself. The natural response of many parents is to "be kind" to their child, do what is comfortable and hope for the best. Many say, "We just do the best we can."

The child who is orally hypersensitive may gag at the sight of a toothbrush, vomit, and engage in a battle royal at oral hygiene time. Sometimes compounding the problem, use of some medications like Dilantin can cause overgrowth of the gums, resulting in extra trapping of bacteria and plaque below the gumline. Without treatment, this accelerates and worsens infection and decay.

Good oral healthcare measures are an important part of any regimen.

OUTCOMES

Over time, even if some brushing takes place, some mouth areas may be avoided, and gingivitis, bleeding, then periodontal disease with bone loss, caries (cavities), and sometimes abscesses develop. Tooth mobility (loosening of teeth) develops. At this point, either teeth shed (fall out), or dental acute care takes place.

For the child or young person with oral pain and hypersensitivity, dental acute care can be extremely trying. Sometimes it is difficult to find someone who will prescribe sedation without general anesthesia, and this can further delay care. Medicaid and most health insurance often deny coverage of the expenses involved.

Another outcome for some children and young people is that as teeth are lost oral control of food and fluids decreases. Teeth are needed to provide the structural support to initiate a normal swallow. When they fall out or are pulled, keeping food and fluid moving in the right direction may no longer be possible. The child may begin to experience increased respiratory secretions, coughing, some aspiration, and their voice quality may seem like they are underwater.

Respiratory infections like bronchitis or pneumonia may occur. In some cases, there is a refusal to eat, weight loss, and continual crying.

Oral Motor Therapy and Normalizing Sensation at Home

For children who are orally defensive, this decline is preventable and even reversible, if it has already begun, with consistent, therapeutic oral hygiene. Actually more appropriate stimulation, not less, is needed, and there is hope. Begin with an evaluation from an occupational therapist or a speech pathologist. Following the evaluation, the devel-

This is the third in a monthly series written for EP Magazine by members of the American Association on Mental Retardation (AAMR).

opment of an appropriate program depends on many factors. One of the most important factors is the child's medical status. For the infant or child who is ill or in a coma, direct work is not possible or appropriate.

However, early stimulation and involvement by an appropriate therapist (one who is trained in oral motor therapy) may be beneficial to the family before any direct work actually begins. During illness or hospitalization, pleasant sensory input into the mouth area may be appropriate.

Treatment usually may begin once the child is medically able to maintain a level of brief periods of conscious awareness. Oral motor treatment initiated at the introduction of tube feedings can prevent the oral hypersensitivity and aversive reactions.

Increased experiences with oral input and the people who provide the input greatly influences the child's development of beliefs about the mouth and the entire oral/feeding process. The success of oral motor treatment is primarily measured by the enjoyment of the mouth and increased use for exploration with sensory awareness and discrimination.

Oral motor treatment may include the following:

- Creating a learning environment
- Improving postural control of head, neck and trunk
- Normalizing the response to stimulation
- Improving tone and movements in the lips and cheeks
- Improving tone and movement in the tongue
- Using the tongue and lips to explore the environment

The first step in preventing oral disease is recognizing when your child is orally defensive and engaging an oral motor specialist to provide an evaluation.

If the child is eating orally, but is defensive orally, a gradual introduction to brushing may begin with the use of wet gauze or a washcloth in the mouth. Gradually move to a soft dry toothbrush (small head). Once a dry toothbrush is accepted, a soft wet toothbrush is introduced. It is important that the child is positioned appropriately (as recommended by an occupational therapist). When possible use a nonalcoholic antibacterial mouthwash. This can be used as the cleansing agent rather than toothpaste, particularly with children who are unable to rinse or spit.

ORAL HYGIENE PLANS

The first step in preventing oral disease is recognizing when your child is orally defensive and engaging an oral motor specialist to provide an evaluation. This person should be either a speech therapist or occupational therapist with oral motor experience with children with special needs. Even when there are no mealtime issues, if oral care is difficult, an evaluation is in order, with the expectation that a specific oral hygiene plan that you can execute at home will be written and demonstrated for you. Your child's body position during oral care should be addressed in the plan. You should require that the therapist train you in how to accomplish the plan at home, with follow up and modification if needed, and periodic evaluation of its effectiveness.

Lee Barks, MN, ARNP, FAAMR, is a nurse clinical specialist-consultant in developmental disabilities. She specializes in working with families and health care delivery systems on disabilities health issues. Lee is an active member of AAMR and serves on the Health Promotion and Prevention Committee. She can be reached at LeeBarks@cfl.rr.com.

Debbie Lord, MA, CCC, SLP/L, FAAMR is the Director of Clinical and Healthcare Services at Ken-Crest Services, Plymouth Meeting, PA. She can be reached at dlord@kencrest.org.

WORLD CONGRESS & EXPOSITION ON DISABILITIES
Hall E1
Hall E2

What People are Saying...

"Merrill Lynch was excited to have the opportunity to participate in the Congress and to bring our team to share their knowledge and experience with the families of special needs children and adults. We look forward to working with the WCD on next year's Congress."
—Nancy Caputo, Assistant Vice President-Global Diversity, Merrill Lynch

"If you thirst for knowledge, this is the place to be. Your one stop for answers."
—Lorilynn Bowie, Marion County Public Schools, Gainsville, FL

"It is like my refueling time for the year when I meet parents and kids that are in the same boat as I. Sometimes we share stories and other times offer support. Best of all you come away feeling refreshed and fired up with a wealth of knowledge that will help in the upcoming year. It is 3 days of fun, fun, fun. If your never tried it, you should. I think you will do as I and return year after year. See ya next September."
—Cari Graham, Babson Park, FL

"This was just great. 3 days with parents who understand." *—Tammy Brown, Lakeland, FL*

"After years of exhibiting at various types of trade shows throughout the United States, we find the WCD show consistently the most rewarding of all. WCD is uniquely able to bring the exhibitor directly face-to-face with the consumer; allowing feedback, fresh ideas and true emotion. What a gift to communicate with these children, to make eye contact, listen, speak, cry, give them a hug, or simply connect with their enormous hearts."
— Kim Gosselin, President, JayJo Books

"Thank you for your dedication to providing the WCD Expo at a reasonable fee which enables families to attend and take part in such an awesome conference! I have attended all three WCD's and plan to return next year. The classes that are offered never fail to enlighten me in at least a couple of subjects, usually in many. The expo hall is also a grand learning experience that I greatly appreciate. It is such a wonderful opportunity for my little girl to be able to actually try adaptive equipment and for me to be able to know (before I begin the ordeal of seeking funding) that a particular item is just right for her. Thank you from both of us for a job well done."
—Kathy Noyes, Davenport, FL

"As a student of occupational therapy, this conference opened my eyes to the many passionate individuals who desire to impact the lives of people with disabilities! It is very exciting to see."
—Cari Brandt, University of St. Augustine, St. Augustine, FL

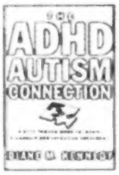
AUTISM

LITTLE RAINMAN
Autism through the eyes of a child
KAREN L. SIMMONS
Written directly by Kren Simmons and indirectly by her autistic son, Jonathan, this was a script so that he could understand himself and his condition of autism. The story as written are the actual events in Jonathan's life. Includes many pictures to help those unable t read to also understand.
FN7295AT **$18.95**

TARGETING AUTISM
What We Know, Don't Know, and Can Do to Help Young Children with Autism and Related Disorders
SHIRLEY COHEN
This new updated edition is a road map of the world of autism for parents, educators, other clinical personnel, and students. Provides a broad framework and richer context of experiences along with conbeying the challenges and fascination of autism using the best current data available
UC4804AT **$14.95**



THE ADHD AUTISM CONNECTION
A Step Toward More Accurate Diagnosis and Effective Treatment
DIANE M. KENNEDY
At age two, Jessy Park was remote, withdrawn, unable to walk or talk, oddly content within the invisible walls that surrounded her. Doctors were baffled. The study of autism was still in its infancy. Jessy's family stepped in. This is one of the more interesting stories ever, a must read.
NEW
WP4980AD **$14.99**

A USER GUIDE TO THE GF/CF DIET FOR AUTISM, ASPERGER SYNDROME AND AD/HD
LUKE JACKSON; WITH APPENDICES BY JACQUI JACKSON; FOREWORD BY MARILYN LE BRETON
Luke Jackson, who is 12 years old and has Asperger Syndrome, tells you everything you need to know, both good and bad. He offers encouragement and practical advice on what to expect when beginning the gluten and casein free diet, how to alleviate any initial discomfort, and how to live with the diet.
NEW
TF0551AS **$17.95**

HEARING IMPAIRED

THE SILENT GARDEN
Raising Your Deaf Child Second Edition
PAUL W. OGDEN
An up to date reference comprising all the bits and pieces of advice, encouragement and hard data that parents might need in order to make decisions that will enable their children to grow into strong, healthy and productive members of society.
CU103DF **$29.95**

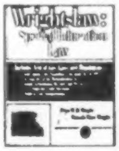
FOR YOUNG PEOPLE

IF THE WORLD WERE BLIND
A Book About Judgement And Prejudice
KAREN GEDIG BURNETT WITH ILLUSTRATIONS BY LAURIE BARROWS
This fascinatingly unique children's story is relevant to everyone, not just the children it is written for. You will find yourself asking how you view people, and what if, you couldn't view them at all?
GRP3040VI **$17.95**

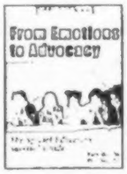
ALWAYS KISS ME GOODNIGHT
Instructions on raising the perfect parent
COMPILED BY J. S. SALT
Instructions on raising the perfect parent as seen in the eyes of 147 children. One of the most popular, entertaining, and insightful books a parent will ever find.
RM1090D **$7.00**

WHY AM I DIFFERENT?
NORMA SIMON WITH PICTURES BY DORA LEDER
This cute story tackles the idea of difference among children in every way except that of disability. That in itself makes the idea of difference easier to understand, accept, and overcome for any child, especially those that may feel more different that any other child.
AW0746YP **$13.95**

SPECIAL EDUCATION



WRIGHTSLAW: SPECIAL EDUCATION LAW
Includes Text of Key Laws and Regulations
PETER W.D. WRIGHT AND PAMELA DARR WRIGHT
This invaluable tool contains the full text of the Individual with Disabilities Education Act, FERPA, Section 504 of the Rehabilitation Act, implementing regulations, and decisions by the U.S. Supreme Court. Each of these statutes is explained and expounded upon by the authors in a way that enables all readers to understand the complex nature of special education law.
WP0037SE **$29.95**



WRIGHTSLAW: FROM EMOTIONS TO ADVOCACY
The Special Education Survival Guide
PAM WRIGHT AND PETE WRIGHT
Whether you are new to special education or an experienced advocate this book will provide you with a clear roadmap to effective advocacy for your child. A practical yet user-friendly text which includes hundreds of strategies, tips, references, warnings and resources. Designed to teach you how to plan, prepare and organize-and get quality special education services.
WP0088SE **$29.95**

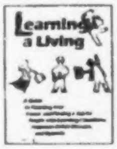
COPIOUS HOSTING
A Theology of Access for People with Disabilities
JENNIE WEISS BLOCK
This book smartly explores disability and theology in wonderfully contemporary terms. The author confesses not to speak for people with disabilities, yet masterfully examines the breadth and depth of the diverse disability community, and relates this body of knowledge to sometimes conservative theological tenets.
CI3496RE **$19.95**

EVERYBODY'S DIFFERENT
Understanding and Changing Our Reactions to Disabilities
NANCY B. MILLER & CATHERINE C. SAMMONS
This book is designed to provide the reader with a new awareness of disability differences in others, better understanding of their internal emotional reactions to disability differences and increased skills for interacting with people who have disability differences.
PR160GN **$21.95**

LEARNING DISABILITIES

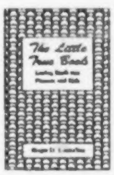
CHILDREN IN NEED OF SPECIAL CARE
THOMAS J. WEIHS, REVISED BY A.M. HAILEY, M.J. HAILEY, AND N.M. BLITZ
This book is a representation of the unique approach to learning disability that Dr. Thomas Weihs utilized. He saw it as not only a pathological condition which has to be remedied, but as a challenge to the self-knowledge and development of a parent or caregiver as well. This classic book explores the unique approach that values human beings as unique individuals.
IC5697GN **$16.95**

NO ONE TO PLAY WITH
Social Problems of LD and ADD Children
BETTY B. OSMAN
One of the first books that recognizes and provides advice on how to cope with the social difficulties encountered on an everyday basis by those with learning disabilities and attention deficit disorders.
AT100LD **$13.00**



LEARNING A LIVING
A Guide to Planning Your Career and Finding a Job for People With Learning Disabilities, ADD, and Dyslexia
DALE S. BROWN
A veritable cornucopia of information and tips about the impact of learning disabilities, feedback from others, useful mentor relationships, among other things. Whatever your career interests, this book will help you become successful in realizing your goals.
WB9675LD **$18.95**

RELIGION



THE LITTLE TRUTH BOOK
Loving Truth for Parents and Kids
ROGER D. CASTERLINE
Do you want a friend for keeps, a real friend? Well Roger D. Casterline will help you get acquainted with one, and his name is Jesus. This book is about relationships, not religion, and if you think you already know Jesus, you can still get to know him even better with the help of this book.
VA9031PA **$8.95**

BEHAVIOR

I Never Get Anything
How to Keep Your Kids from Running Your Life
Thomas W. Phelan, Ph.D.

From the time they are toddlers children try to "press their parents buttons" in order to get their way. In this balanced insightful book the author identifies the Six Kinds of Testing and Manipulation youngsters use to get their own way: Badgering, Temper, Threat, Martyrdom, Butter Up, and Physical Tactics. This practical and sometimes humorous guide explains to Moms and Dads exactly what to expect from frustrated kids and how to handle it — gently and firmly.

CMOL39BE **12.95**

Raising Children Who Refuse To Be Raised
Dave Ziegler, Ph.D.

This book is for both parents and professionals who are involved with the care of children who have severe emotional or behavioral disturbances as the result of abuse or neglect. The three major sections cover: Emotional disturbances, Where it all Begins; Behavioral Disturbances: There is More than Meets the Eye; and lastly Advanced parenting Skills and Challenges. The 12 chapters contain detailed discussions of emotional or behavioral disorders, their causes and possibilities for treatment.

AC87270N **$19.99**

GENERAL

Neuroimaging
A Window To The Neurological Foundations of Learning and Behavior in Children
G. Reid Lyon, Judith M. Rumsey

Explores the application of anatomical and functional neuroimaging techniques and procedures to the understanding of specific medical conditions and developmental disabilities in children. Includes two chapters covering the basic biological and methodological concepts needed to understand neuroimaging procedures.

PB2568NI **$49.95**

Putting Children First
Hanna McDonogh
and Christina Barthia

Besieged by multiple emotional, financial, legal, and practical stresses, divorcing parents are at heart often deeply worried and guilty about their children. This book provides ways for parents to develop the skills necessary to help their children in this period such as understanding grieving, relationships, mediation, court proceedings, and much more.

UT0642CN **$17.95**

The Shy Child
Helping Children Triumph Over Shyness
Ward K. Swallow

This authoritative interactive guide focuses on the problems of shyness and provides parents and children with pragmatic step-by-step solutions. It will help you achieve wonderful results such as stronger warmer relationships with family and friends, and a child who looks confidently to the future.

TW4990CN **$13.95**

Distant Drums, Different Drummers
A guide for young people with ADHD
Barbara D. Ingersoll, Ph. D.

A view that offers children and adolescents struggling with ADHD the opportunity to see them selves in a positive light due to their penchant for novelty and exploration and boundless energy.

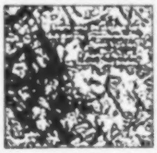
CP1000AD **$15.95**

BRAIN INJURY

The Experts Speak
Parenting the Child With Learning Disabilities
Teresa A. Citro

A clear, comprehensive, and direct collection of writings by professionals in the field of learning disabilities in their area of concentration. Whether it is teaching, parenting, or socialization there are stories on it here.

LD2001LD (English) **$18.99**
LD7129LD (Spanish) **$18.99**



Signs and Strategies for Educating Students with Brain Injuries
A Practical Guide for Teachers and Schools
G. Wolcott, M. Ed.,
M. Lash, M.S.W., &
S. Pearson, M.A.

Filled with useful guidelines, practical tips, and intervention strategies that enable parents and teachers to better understand the educational needs of children and adolescents with brain injuries.

HI1760D **$24.95**

Childhood Traumatic Brain Injury
diagnosis, Assessment and Intervention

A well balanced and comprehensive treatise on childhood traumatic brain injury. Covers a wide variety of issues surrounding brain injury in children from social expectations to assessment of skills.

PE1438I **$38.95**

VISUALLY IMPAIRED

Children with Visual Impairments
A Parents' Guide
Edited: M. Cay Holbrook, Ph.D.

Designed to help parents get a handle on common types of concerns. Written by a team of professionals and parents, each of whom is an expert on a different aspect of caring for children with visual impairments.

WB17900 **$16.95**

Transition Issues Related to Students with Visual Disabilities
Jane N. Erin and Karen E. Wolffe

An explanation and analysis of the critical areas in the lives of those with visual impairments, such as transportation, academics, employment and recreation.

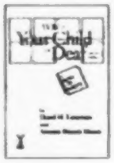
PE168VI **$12.95**

HEARING IMPAIRED

Kid-Friendly Parenting With Deaf and Hard Of Hearing Children
A Treasury of Fun Activities Toward Better Behavior
Daria Medwid and
Denise Chapman Weston

A step-by-step guide offering hundreds of ideas and methods designed to work with children ages 3 to 12 to enhance communication and strengthen relationships in skillful, fun ways.

CU1010F **$24.95**



When Your Child Is Deaf
A Guide for Parents
David M. Luterman with Antonia Brancia Maxon

This must read book provides information for parents about the emotional and educational processes of coming to grips with a hearing impairment in their child. Parents of newly diagnosed hearing impaired children as well as parents of a child with a hearing impairment at any age will find this book helpful.

familiar faces

SOPHIE

Sophie Pettman, 2, loves Christmas. She has chromosome 9qt. She loves music, dancing and is happy to cuddle-up and read books with anyone willing. Her parents refer to her as their "little angel."

JAVONTE

Javonte Forbes, 3, gets a lot of love from his cousin Ernestine (hugging him), who adores him very much. JJ has cerebral palsy, but that doesn't stop him from smiling, laughing and walking around in his walker. He is an only child but loves his therapy sessions because he gets to play with other kids his age. He also enjoys watching television while rocking in his chair. A few of his favorite shows include "Sponge Bob Square Pants," "Dora," "Blues Clues" and "Sesame Street."

ALEX

Alexander Franklin Sing was born with Mohr-Majewski Syndrome and Oral-Facial-Digital Syndrome II. Assistance comes from a trach, oxygen tank and a ventilator. Alex is always thinking about his future. Some dreams are to become a teacher, writer, or an actor. He loves his family and friends. His favorite leisure activities include reading a good fantasy book and watching wrestling.

KIMBERLY

Kimberly Yuknig, 2, lives at home with her mom, dad and two German Shepard dogs, Cleo (left) and Thunder (right). She has periventricular leukomalacia and CP. She loves singing, swimming, yoga, Pooh Bear and "Blue's Clues."

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (Exceptional Parent), 65 E. Route 4, River Edge, NJ 07661. (Please do not send "one-of-a-kinds" as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

My Favorite Cousin

By: Andrea Tocci

Gabi and Andrea

Gabrielle Nicole Statltare is my cousin, my favorite cousin. She has brown curly hair, beautiful brown eyes and a smile that makes me happy. She laughs at silly things and cries when she is sad. She has a little sister named Victoria. Gabi is her nickname and the moment people meet her they love her.

Gabi was born on May 10, 1994. Everyone was so excited. Unfortunately, due to a doctor's error, Gabi lost oxygen to her brain, which resulted in many disabilities, including low vision and mainly cerebral palsy. This means that Gabi can't walk unaided; at least, not yet! Gabi also cannot speak too well but she will let you know when she wants something! I am proud because my name is one of the names she can say.

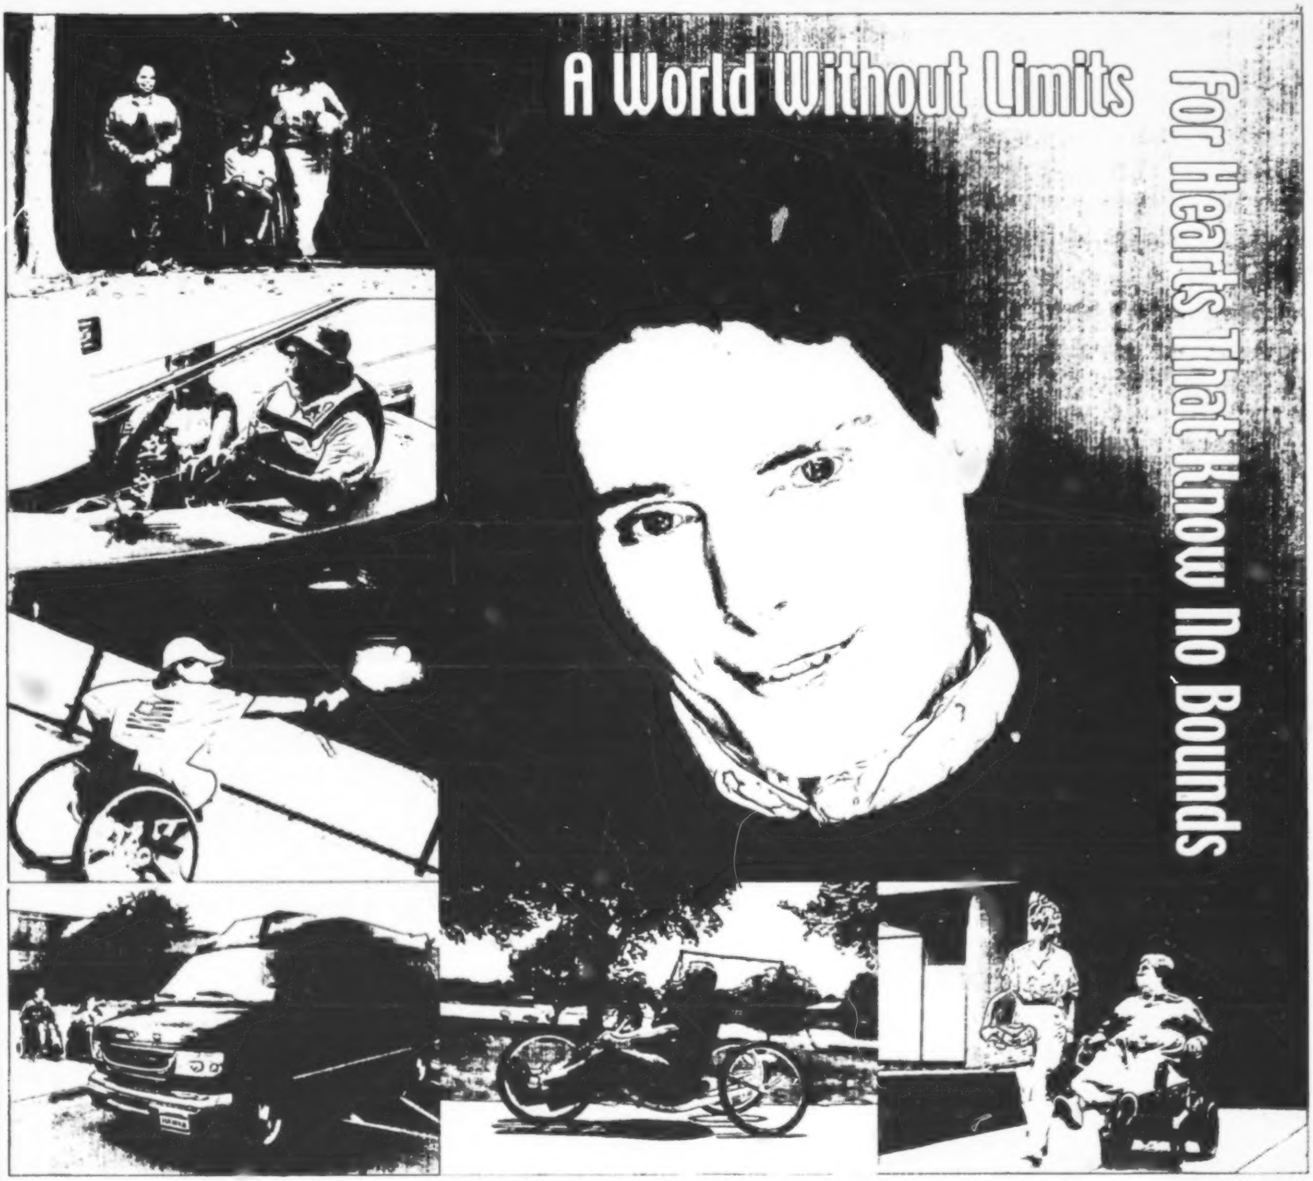
At first, I was nervous around Gabi because I thought I would hurt her. After I got to know her special needs I wasn't nervous anymore. Gabi has always been treated like any other kid. Even though she has many people to care for her we still have fun together. Gabi squeals in delight when she pulls my hair and I act like she is hurting me. Some of the first amusement park rides Gabi went on, I was right behind her, holding her and laughing along with her. Gabi and I have a special bond that only we share.

In October of 1995 Gabi and her mom, my Aunt Garbara, were invited to St. Patrick's Cathedral in New York City for a special mass. It was the year that Pope John Paul II was in the United States. My Aunt Barbara made her way to the front row where Mayor Giuliani was sitting. When the Pope came down the aisle he stopped at Gabi and took her from my Aunt's arms. He held her and asked my Aunt what her illness was and my Aunt told him. Pope John Paul II kissed Gabi's left eye and told my Aunt that he would pray for her. When we found out that Gabi's vision had improved in her left eye we knew it was a miracle.

Gabi goes to a great school in Long Island, NY called the Carmen Road School for Physically Handicapped Children. They do so many things to encourage growth in body, mind and spirit. Gabi makes some awesome things at her school. During the school year Gabi's teachers send me cards from her. The cards are so special to me. In the summer Gabi goes to Camp Anchor. It is a special summer camp for children with special needs. They go in the pool, play games, make crafts and go on field trips. At the end of the summer they have a carnival and I get to go and see Gabi's friends and teachers. Because of how happy Camp Anchor makes Gabi and other children I am hoping to one day work there.

I think Gabi's life is an inspiration to me because she is very brave and courageous. She works so hard to do things that we take for granted. When I think about how hard it is to do something, I think about Gabi and it gives me courage to do it. I know Gabi will live a happy and fulfilling life because she has so many people that love and encourage her. I have found through Gabi that love comes from within your heart. EP

Submit your Children's Page to: EP, ATTN: CHILDREN'S PAGE, 65 East Route 4, River Edge, NJ 07661. Be sure to include your name, address, daytime telephone number and e-mail address! ***Now on the Web!*** We now include **Familiar Faces** and **Children's Page** on our Web site, http://www.eparent.com. Please send us your photographs with the understanding that doing so gives EP permission to put the photos on the EP Web site, exactly as they appear in the magazine and with the same text.



A World Without Limits
For Hearts That Know No Bounds

For more than ten years Ford Mobility Motoring has been Ford Motor Company's better idea of a comprehensive process of financial assistance, adaptive equipment information and credit assistance for Ford customers with disabilities and their families.

- Ford, Mercury and Lincoln cars, vans and light trucks. **Vehicle solutions** for every adaptive equipment need!
- Ford Credit Financing provides **purchase and lease solutions** accommodating the special vehicle needs of persons with disabilities and their families.
- Up to **$1,000 in financial assistance** for adding adaptive equipment to eligible Ford, Mercury and Lincoln vehicles.[1]
- Adaptive equipment assessment centers and installer **resource listings** tailored to every state.

Begin your Ford Mobility Motoring experience by calling Program Headquarters.

MOBILITY FINANCING

CHRISTOPHER REEVE
PARALYSIS FOUNDATION

The Christopher Reeve Paralysis Foundation (CRPF) encourages and supports research to develop effective treatments and a cure for paralysis caused by spinal cord injury and other central nervous system disorders. The foundation evaluates and selects these research programs using councils of internationally renowned neuroscientists and clinicians. The Foundation also allocates a portion of its resources to grants that improve the quality of life for people with disabilities.

---

[1] The 2003 Ford Mobility Motoring Program is in effect from September 1, 2002 through August 31, 2003. The Ford Mobility Motoring Program will reimburse for the exact amount of the adaptation, up to $1,000 on adaptive equipment and up to a maximum amount of $200 for alert hearing devices, lumbar support and running boards, when you take retail delivery of a new 2002, 2003 or 2004 Ford, Mercury or Lincoln vehicle by August 31, 2003. Total reimbursement is not to exceed $1,000.

A Better Bedtime Story

The Vail Enclosed Bed

Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for you child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt.

Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from th manufacturer.
